

## Introduction

The XPS BRAM Interface Controller is a Xilinx IP module that incorporates a PLB V4.6 (Processor Local Bus) interface. This controller is designed to be byte accessible. Any access size (in bytes) up to the parameterized data width of the BRAM is permitted. The XPS BRAM Interface Controller is the interface between the PLBV46 and the bram\_block peripheral. A BRAM memory subsystem consists of the controller along with the actual BRAM components that are included in the bram\_block peripheral. If the text-based Microprocessor Hardware Specification (MHS) file is used for design entry in EDK, then the xps\_bram\_if\_cntlr and bram\_block must both be explicitly instantiated.

## Features

- PLB V4.6 bus interface with byte enable support
  - Xilinx Baseline and Performance Slave operation modes
  - 32, 64, and 128-bit wide PLB interface support
  - 32, 64, and 128-bit BRAM width support
  - 32-bit addressing support
- Supports up to three transfer types
  - Single data beat
  - Cacheline 4/8
  - Fixed Length Burst 2 to 16 data beats
- Used in conjunction with Xilinx EDK generated bram\_block peripheral to provide total BRAM memory solution

## Functional Description

Figure 1 illustrates the functional composition of the core. The core design is written using VHDL and is named `xps_bram_if_cntlr.vhd`. The module is designed to be connected to a separate BRAM memory module and therefore does not provide for the BRAM memory instantiations. The primary components are the Slave Interface modules. There are two, one for Baseline operation mode and one for Performance operation mode. These modules are custom designs and provide all address decoding (32-bit address) and supports 32, 64, and 128-bit data accesses of the BRAM. Depending on parameterization assignments, these accesses may be comprised of single data beat, cacheline 4/8, and fixed length burst transfers. The Interface modules are designed to be compatible with the Processor Local Bus Architecture Specification (v4.6).

## I/O Signals

The XPS BRAM Interface Controller signals are listed and described in [Table 1](#).

**Table 1: XPS BRAM Interface Controller I/O Signal Description**

Signal Name	Interface	Signal Type	Init Status	Description
<b>System Signals</b>				
SPLB_Clk	System	I		PLB System synchronization Clock
SPLB_Rst	System	I		PLB System PLB Reset
<b>PLB Slave Request Signals</b>				
PLB_ABus(0:31)	PLB	I		PLB address bus
PLB_UABus(0:31)	PLB	I		PLB upper address bus
PLB_PAVValid	PLB	I		PLB primary address valid indicator
PLB_SAVValid	PLB	I		PLB secondary address valid indicator
PLB_rdPrim	PLB	I		PLB secondary to primary read request promotion
PLB_wrPrim	PLB	I		PLB secondary to primary write request promotion
PLB_masterID(0:C_SPLB_MID_WIDTH-1)	PLB	I		PLB requesting master identification
PLB_abort	PLB	I		PLB bus request abort
PLB_busLock	PLB	I		PLB bus lock
PLB_RNW	PLB	I		PLB read not write
PLB_BE(0:(C_SPLB_DWIDTH / 8) -1)	PLB	I		PLB byte enables
PLB_MSize(0:1)	PLB	I		PLB master data bus size
PLB_size(0:3)	PLB	I		PLB transfer size
PLB_type(0:2)	PLB	I		PLB transfer type
PLB_lockErr	PLB	I		PLB lock error
PLB_wrDBus(0:C_SPLB_DWIDTH -1)	PLB	I		PLB write data bus

Table 1: XPS BRAM Interface Controller I/O Signal Description

Signal Name	Interface	Signal Type	Init Status	Description
<b>PLB Slave Reply Signals</b>				
Sl_addrAck	PLB	O	'0'	Slave address acknowledge
Sl_SSize(0:1)	PLB	O	Zeros	Slave data bus size
Sl_wait	PLB	O	'0'	Slave wait indicator
Sl_rearbitrate	PLB	O	'0'	Slave rearbitrate bus indicator
Sl_wrDAck	PLB	O	'0'	Slave write data acknowledge
Sl_wrComp	PLB	O	'0'	Slave write transfer complete indicator
Sl_wrBTerm	PLB	O	'0'	Slave terminate write burst transfer
Sl_rdDBus(0:C_SPLB_DWIDTH -1)	PLB	O	Zeros	Slave read bus
Sl_rdWdAddr(0:3)	PLB	O	Zeros	Slave read word address
Sl_rdDAck	PLB	O	'0'	Slave read data acknowledge
Sl_rdComp	PLB	O	'0'	Slave read transfer complete indicator
Sl_rdBTerm	PLB	O	'0'	Slave read burst terminate indicator
Sl_MBusy(0:C_SPLB_NUM_MASTERS-1)	PLB	O	Zeros	Slave busy indicator (1 bit for each PLB Master)
Sl_MWrErr(0:C_SPLB_NUM_MASTERS-1)	PLB	O	Zeros	Slave write error indicator (1 bit for each PLB Master)
Sl_MRdErr(0:C_SPLB_NUM_MASTERS-1)	PLB	O	Zeros	Slave read error indicator (1 bit for each PLB Master)
Sl_MIRQ(0:C_SPLB_NUM_MASTERS-1)	PLB	O	Zeros	Slave interrupt indication (1 bit for each PLB Master)
<b>BRAM Interface Signals</b>				
BRAM_Rst	BRAM Block	O	Follows SPLB_Rst	Active high signal used to initialize the BRAM Memory. It is an echo of the SPLB_Rst input port
BRAM_Clk	BRAM Block	O	Follows SPLB_Clk	BRAM Clock used to synchronize the operation of the BRAM memory block. It is an Echo of the SPLB_Clk input port
BRAM_EN	BRAM Block	O	'0'	Active high signal indicating to the BRAM memory that an access is in progress.
BRAM_WEN(0:(C_SPLB_NATIVE_DWIDTH/8)-1)	BRAM Block	O	Zeros	A bus of signals used to qualify write operation to the BRAM memory. Each bit within the bus corresponds to a byte position within the BRAM data word. The assertion of a WEN bit in conjunction with the assertion of the BRAM_EN signal and a rising edge of the BRAM_Clk constitutes a valid write condition to the address specified by the BRAM_Addr.

Table 1: XPS BRAM Interface Controller I/O Signal Description

Signal Name	Interface	Signal Type	Init Status	Description
BRAM_Addr(0:C_SPLB_AWIDTH-1)	BRAM Block	O	Zeros	Address bus to the BRAM memory. See Section "BRAM_Addr Usage" on page 9 for a discussion of the specific bits needed for the typical BRAM memory application.
BRAM_Din(0:C_SPLB_NATIVE_DWIDTH-1)	BRAM Block	I	Zeros	Read Data bus from the BRAM memory. Data from the BRAM Memory is assumed to be valid on this bus at the rising edge of the next sequential BRAM_Clk cycle after the clock cycle in which the desired assertion of the BRAM_Addr and the BRAM_EN signals are made.
BRAM_Dout(0:C_SPLB_NATIVE_DWIDTH-1)	BRAM Block	O	Zeros	Output data bus used to transfer Write data to the BRAM Memory. Write data is written when the BRAM_EN and the BRAM_WEN signals are asserted and a rising edge of BRAM_Clk occurs.

## XPS BRAM Interface Controller Parameters

To allow you to obtain an XPS BRAM Interface Controller that is uniquely tailored for your system, certain features can be parameterized in the XPS BRAM Interface Controller design. This allows you to configure a design that only utilizes the resources required by your system, and operates with the best possible performance. The features that can be parameterized in Xilinx XPS BRAM Interface Controller design are shown in Table 2.

Table 2: XPS BRAM Interface Controller Design Parameters

Feature/Description	Parameter Name	Allowable Values	Default Values	VHDL Type
<b>User Specified Features</b>				
BRAM Base Address	C_BASEADDR	System Address value of C_SPLB_AWIDTH bits wide <sup>(2)</sup>	FFFF_FFFF <sup>(1)</sup>	std_logic_vector
BRAM HIGH Address	C_HIGHADDR	System Address value of C_SPLB_AWIDTH bits wide <sup>(2)</sup>	0000_0000 <sup>(1)</sup>	std_logic_vector
Specify the required BRAM Interface Data Width	C_SPLB_NATIVE_DWIDTH	32, 64, or 128	32	integer
<b>Tool Specified Features</b>				
PLB Address Bus Width	C_SPLB_AWIDTH <sup>(3)</sup>	32, 36 <sup>(4)</sup>	32	integer
PLB Data Bus Width	C_SPLB_DWIDTH <sup>(3)</sup>	32, 64, or 128	32	integer
Number of Masters	C_SPLB_NUM_MASTERS <sup>(3)</sup>	1 - 16	2	integer
Width of Master ID Bus	C_SPLB_MID_WIDTH <sup>(3)</sup>	roundup(log <sub>2</sub> (C_SPLB_NUM_MASTERS))	1	integer

Table 2: XPS BRAM Interface Controller Design Parameters

Feature/Description	Parameter Name	Allowable Values	Default Values	VHDL Type
Optimization mode for PLB burst and cacheline transfers	C_SPLB_SUPPORT_BURSTS <sup>(3)</sup>	0 = Optimized for resource savings at the price of only supporting single data beat transfers 1 = Transfer Optimized Mode for Single Data Beat, Fixed Length Burst, and Cacheline 4/8 up to 128-bits wide at the price of higher resource utilization of the core	1	integer
Enable Support for Point to Point interconnect configuration	C_SPLB_P2P <sup>(3)</sup>	0 = Normal Mode 1 = Point to Point Optimizations Enabled <sup>(5)</sup>	0	Integer
Indicates the Smallest Width Master that may access the XPS BRAM Interface Controller	C_SPLB_SMALLEST_MASTER <sup>(3)</sup>	32, 64, or 128	32	Integer
Target FPGA device family	C_FAMILY <sup>(3)</sup>	spartan3a, aspartan3a, virtex4, qvirtex4, qrvirtex4, virtex5	virtex5	String
<p><b>Note:</b></p> <ol style="list-style-type: none"> <li>1. Default values are specified for C_BASEADDR and C_HIGHADDR to insure that they are set by the User. If the value is not set, an implementation error will be generated.</li> <li>2. C_BASEADDR value must be a power of 2 and a multiple of the desired address range, where the address range is (C_HIGHADDR+1) - C_BASEADDR. Example base address settings are shown in <a href="#">Table 4</a> in the <a href="#">Setting the C_BASEADDR and C_HIGHADDR Parameters</a> section.</li> <li>3. These parameters are calculated and automatically assigned by the EDK XPS tools during the system creation process</li> <li>4. Xilinx EDK limits addressing to 32-bits.</li> <li>5. Point to Point optimizations include removal of address decoding. This mode is not usable in a shared bus interconnect environment.</li> </ol>				

## Parameter - Port Dependencies

Table 3: XPS BRAM Interface Controller Parameter-Port Dependencies

Generic or Port	Name	Affects Port	Depends on Parameter	Relationship Description
<b>Design Parameters</b>				
G1	C_SPLB_NATIVE_DWIDTH	P1, P2, P3		Port widths are set directly or derived from the parameter value
G2	C_SPLB_NUM_MASTERS	P5, P6, P7, P8		Port widths are set directly or derived from the parameter value
G3	C_SPLB_MID_WIDTH	P12		Port width is set directly by the parameter value
G4	C_SPLB_DWIDTH	P9, P10, P11		Port widths are set directly or derived from the parameter value
G5	C_SPLB_AWDITH	P4		Port width is set directly by the parameter value
<b>I/O Signals</b>				
P1	BRAM_Din		G1	Port width is set directly by the parameter value
P2	BRAM_Dout		G1	Port width is set directly by the parameter value
P3	BRAM_WEN		G1	Port width is derived from the parameter value
P4	BRAM_ABus		G5	Port width is set directly by the parameter value
P5	SI_MBusy		G2	Port width is set directly by the parameter value
P6	SI_MWrErr		G2	Port width is set directly by the parameter value
P7	SI_MRdErr		G2	Port width is set directly by the parameter value
P8	SI_MIRQ		G2	Port width is set directly by the parameter value
P9	PLB_BE		G4	Port width is derived from the parameter value
P10	PLB_wrDBus		G4	Port width is set directly by the parameter value
P11	SI_rdDBus		G4	Port width is set directly by the parameter value
P12	PLB_masterID		G3	Port width is set directly by the parameter value

## Register Descriptions

There are no User programmable registers for this IP core.

## Application Information

### Setting the C\_BASEADDR and C\_HIGHADDR Parameters

The base address (C\_BASEADDR) and high address (C\_HIGHADDR) parameters must specify a valid range for the BRAM memory configuration that is attached to the xps\_bram\_if\_cntlr. The range (C\_HIGHADDR – C\_BASEADDR) specified by the high address and base address must be equal to  $2^n$  bytes minus 1, where  $n$  is a positive integer and  $2^n$  is a valid memory size as shown in [Table 5](#) or [Table 6](#) depending on the target device family. In addition, the C\_BASEADDR value must be a multiple of the desired memory size (or address range). Examples of valid C\_BASEADDR and C\_HIGHADDR settings for various memory sizes are shown in [Table 4](#).

**Table 4: Example Address Range Specifications for C\_BASEADDR and C\_HIGHADDR**

Memory Size (Bytes)	Basic Address Range Required	C_BASEADDR	C_HIGHADDR
8K	0x0000_0000 to 0x0000_1FFF	0xE00A0000	0xE00A1FFF
16K	0x0000_0000 to 0x0000_3FFF	0x3FF00000	0x3FF03FFF
32K	0x0000_0000 to 0x0000_7FFF	0x82000000	0x82007FFF
64K	0x0000_0000 to 0x0000_FFFF	0xB0010000	0xB001FFFF
128K	0x0000_0000 to 0x0001_FFFF	0x00820000	0x0083FFFF
256K	0x0000_0000 to 0x0003_FFFF	0xFFFC0000	0xFFFFFFFF

### Point to Point vs. Shared Bus Configuration Differences

The input parameter C\_SPLB\_P2P configures PLB interface logic for the type of interconnect topology used to connect the XPS BRAM Interface Controller in the Host system. When C\_SPLB\_P2P is set to 0, the interface is configured for shared bus. In this mode, the interface incorporates the normal address decoding logic. When C\_SPLB\_P2P is set to 1, the interface is configured for point to point type connection with a PLB Master. Address decoding is eliminated and the interface responds to all valid requests from the Master regardless of address.

### Special Resource Optimized Mode

The XPS BRAM Interface Controller provides a special resource optimized mode for resource critical applications not requiring high data transfer performance. This mode is activated when the C\_NATIVE\_DWIDTH parameter is set to 32 and the C\_SUPPORT\_BURSTS parameter is set to 0. In this mode, only 32-bit single data beat transfers are supported. This is the Xilinx Baseline operation mode.

## Backend BRAM Block Interface

There are 7 ports comprising the backend interface of the XPS BRAM Interface Controller. These ports are used to interface directly with a User's BRAM memory. These ports are:

- BRAM\_Rst
- BRAM\_Clk
- BRAM\_EN
- BRAM\_WEN (bus)
- BRAM\_Addr (bus)
- BRAM\_Din (bus)
- BRAM\_Dout (bus)

Port properties and a brief description of each can be found in [Table 1, "XPS BRAM Interface Controller I/O Signal Description,"](#) on page 3.

### BRAM\_Addr Usage

The address bus output port BRAM\_Addr is sized according to the C\_SPLB\_AWIDTH parameter value. Currently, this is fixed by the EDK tools at 32 bits. This is obviously more addressing capability than the usual BRAM memory requires. In addition, the address provided is a byte address that is derived from the PLB start address provided during the Address Phase of the associated PLB request. Generally, a BRAM memory array configurations do not use the address bits that delineate byte positions within the base data width of the memory. Instead, individual byte write qualifier signals are used. These are provided by the BRAM\_WEN output port. Thus, the lower order address bits of the BRAM\_Addr bus will be unused. The User is required to rip the appropriate address signals from the BRAM\_Addr bus for use by the BRAM memory configuration being implemented. The number of address bits required and used address bits for Spartan-3 and Virtex-4 devices are shown in [Table 5](#), and in [Table 6](#) for Virtex-5 devices.

### Supported BRAM Memory Configurations

Typical BRAM memory configurations that are supported by this BRAM Controller are shown in [Table 5](#), for Spartan-3 and Virtex-4 devices and in [Table 6](#) for Virtex-5 devices. **Note that the BRAM instantiations are not provided by this core. They are part of the bram\_block module generated by the EDK XPS tools during embedded system creation**

*Table 5: Supported BRAM Memory sizes for Virtex-4 and Spartan-3 FPGAs*

Native Data Width Size (bits)	Supported Memory Sizes (Bytes) / BRAM Memory Configuration (Depth x Width)	Number of BRAM primitives (18Kbit ea.) required	Number of BRAM_Addr bits required	Typical BRAM_Addr(0:31) bit usage for BRAM width
C_NATIVE_DWIDTH = 32				
32	8K / (2,048x32)	4 (1)	11	BRAM_Addr(17:29)
32	16K / (4,096x32)	8	12	BRAM_Addr(16:29)
32	32K / (8,192x32)	16	13	BRAM_Addr(15:29)
32	64K / (16,384x32)	32	14	BRAM_Addr(14:29)
C_NATIVE_DWIDTH = 64				

Table 5: Supported BRAM Memory sizes for Virtex-4 and Spartan-3 FPGAs

Native Data Width Size (bits)	Supported Memory Sizes (Bytes) / BRAM Memory Configuration (Depth x Width)	Number of BRAM primitives (18Kbit ea.) required	Number of BRAM_Addr bits required	Typical BRAM_Addr(0:31) bit usage for BRAM width
64	16K / (2,048x64)	8 <sup>(2)</sup>	11	BRAM_Addr(18:28)
64	32K / (4,096x64)	16	12	BRAM_Addr(17:28)
64	64K / (8,192x64)	32	13	BRAM_Addr(16:28)
64	128K / (16,384x64)	64	14	BRAM_Addr(15:28)
C_NATIVE_DWIDTH = 128				
128	32K / (2,048x128)	16 <sup>(3)</sup>	11	BRAM_Addr(16:27)
128	64K / (4,096x128)	32	12	BRAM_Addr(15:27)
128	128K / (8,192x128)	64	13	BRAM_Addr(14:27)
128	256K / (16,384x128)	128	14	BRAM_Addr(13:27)
<b>Note:</b>				
1. A minimum of 4 BRAM primitives are required to maintain byte write capability for a 32-bit native data width BRAM array.				
2. A minimum of 8 BRAM primitives are required to maintain byte write capability for a 64-bit native data width BRAM array.				
3. A minimum of 16 BRAM primitives are required to maintain byte write capability for a 128-bit native data width BRAM array.				

Table 6: Supported BRAM Memory sizes for Virtex-5 FPGAs

Native Data Width Size (bits)	Supported Memory Sizes (Bytes) / BRAM Memory Configuration (Depth x Width)	Number of BRAM primitives (36Kbit ea.) required	Number of BRAM_Addr bits required	Typical BRAM_Addr(0:31) bit usage for 64-bit wide Memory (8 byte lanes)
C_NATIVE_DWIDTH = 32				
32	4K / (1,024x32)	1 <sup>(1)</sup>	10	BRAM_Addr(20:29)
32	8K / (2,048x32)	2	11	BRAM_Addr(19:29)
32	16K / (4,096x32)	4	12	BRAM_Addr(18:29)
32	32K / (8,192x32)	8	13	BRAM_Addr(17:29)
32	64K / (16,384x32)	16	14	BRAM_Addr(16:29)
32	128K / (32,768x32)	32	15	BRAM_Addr(15:29)
C_NATIVE_DWIDTH = 64				
64	8K / (1,024x64)	2 <sup>(1)</sup>	10	BRAM_Addr(19:28)
64	16K / (2,048x64)	4	11	BRAM_Addr(18:28)
64	32K / (4,096x64)	8	12	BRAM_Addr(17:28)
64	64K / (8,192x64)	16	13	BRAM_Addr(16:28)
64	128K / (16,384x64)	32	14	BRAM_Addr(15:28)

Table 6: Supported BRAM Memory sizes for Virtex-5 FPGAs

Native Data Width Size (bits)	Supported Memory Sizes (Bytes) / BRAM Memory Configuration (Depth x Width)	Number of BRAM primitives (36Kbit ea.) required	Number of BRAM_Addr bits required	Typical BRAM_Addr(0:31) bit usage for 64-bit wide Memory (8 byte lanes)
64	256K / (32,768x64)	64	15	BRAM_Addr(14:28)
C_NATIVE_DWIDTH = 128				
128	16K / (1,024x128)	4 (1)	10	BRAM_Addr(18:27)
128	32K / (2,048x128)	8	11	BRAM_Addr(17:27)
128	64K / (4,096x128)	16	12	BRAM_Addr(16:27)
128	128K / (8,192x128)	32	13	BRAM_Addr(15:27)
128	256K / (16,384x128)	64	14	BRAM_Addr(14:27)
128	512K / (32,768x128)	128	15	BRAM_Addr(13:27)
<b>Notes:</b>				
1. Virtex-5 BRAM primitives have up to 4 byte enables per primitive.				

### Data Types and Organization

The BRAM interface ports are designed to interface with a BRAM Memory via a big-endian data structure. The byte ordering and bit numbering for this structure is shown in Figure 2.

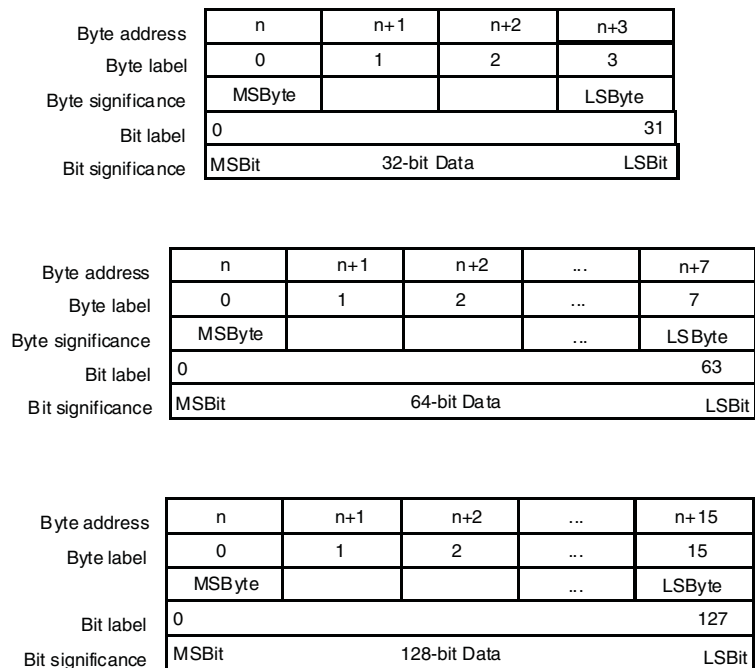

Figure 2: Big-Endian Byte Ordering and Left to Right Bit Numbering

### Typical PLB Timing

- The following text and sequence of figures describes and shows typical timing relationships of the Slave reply signals of this core. All PLB transactions are made up of two time phases known as the Address Phase

and the Data Phase. The Address Phase occurs first and is the period of time where the PLB arbiter gates the PLB Master's request address and qualifiers to the PLB and indicates these signals are valid via the assertion of the PLB\_PAVValid signal. It is during this phase that the PLB Slave device is required to decode the incoming address and respond if the address is within the Slave's assigned address space. Typically, the address phase is completed when the addressed Slave device responds with an assertion of the SI\_addrAck or SI\_rearbitrate. When an Address Phase is completed with a SI\_addrAck assertion, then the PLB Data Phase is initiated. As the name implies, this is the period of time where the actual data transfer occurs. It is during the Data Phase that the BRAM interface signals are active. The XPS BRAM Interface Controller supports 3 PLB transfer types for Data Phase operations. These are:

- Single Data Beat Read and Write
  - 1-4 bytes (32-bit Native Data Width)
  - 1-8 bytes (64-bit Native Data Width)
  - 1-16 bytes (128-bit Native Data Width)
- Cacheline Read and Write (4 word and 8 word; Note that 16 word Cacheline requests are not supported)
- Fixed Length Burst Read and Write (2 to 16 Data Beats per request)
  - Transfer size of word supported for 32-bit Native Data Width
  - Transfer size of word and double word supported for 64-bit Native Data Width
  - Transfer size of word, double word, and quad word for 128-bit Native Data Width

A Data Phase is generally signaled to be completed with the assertion of the SI\_rdComp or SI\_wrComp signal by the responding Slave device. At that time, the arbiter may arbitrate and drive the next pending request onto the PLB. For information on these and other PLB protocol and signaling scenarios, please refer to the IBM PLB Architecture Specification (v4.6).

### Single Data Beat Read Transfer

A Single Data Beat Read is used to transfer 1 to 4 bytes (32-bit Native Data Width), 1 to 8 bytes (64-bit Native DWidth), or 1 to 16 bytes (128-bit Native DWidth) of data from the target Slave to the requesting PLB Master. The requested byte lanes are asserted by the Master via the PLB\_BE input bus. However, in the case of the BRAM memory, a read is not destructive so the byte enable selections are not echoed to the BRAM interface ports. The XPS BRAM Interface Controller expects the BRAM memory to provide a full bus width of data for all read data beats. During a Single Data Beat read, the data is transferred during a single PLB clock cycle that is denoted by the assertion of the SI\_rdDack and SI\_rdComp by the Slave. **Figure 3** shows the timing of a Single Data Beat Read transfer.

Note that this diagram is for a 64-bit wide PLB and a BRAM Native DWIDTH of 64 bits.

Figure 3: Single Data Beat Read

### Single Data Beat Write Transfer

A Single Data Beat Write is used to transfer 1 to 4 bytes (32-bit Native Data Width), 1 to 8 bytes (64-bit Native DWidth), or 1 to 16 bytes (128-bit Native DWidth) of data from the requesting PLB Master to the target Slave. The data is transferred during a single PLB clock cycle that is denoted by the assertion of the SI\_wrDack by the Slave. The Master specifies which byte positions are to be modified via the PLB\_BE qualifier bus. The bit assertions within the PLB\_BE bus are translated to the generation of the appropriate BRAM\_WEN bit assertions that are sent to the User BRAM memory block. The signal timing of a Single Data Beat Write operation is shown in Figure 4.

Note that this diagram is for a 64-bit wide PLB and a BRAM Native DWIDTH of 64 bits.

Figure 4: Single Data Beat Write

### 8-Word Cacheline Read (C\_SPLB\_SUPPORT\_BURSTS = 1)

PLB V4.6 Cacheline 8-word read transactions are supported by the BRAM Interface Controller. An 8-word Cacheline read is completed in 4 data beats during the Data Phase on the PLB V4.6 bus as shown in Figure 6. All byte lanes are used during Cacheline reads.

Note that this diagram is for a 64-bit wide PLB and a BRAM Native DWIDTH of 64 bits. The actual data width of the requesting Master and the actual Native Data Width of the BRAM Interface Controller can change the number of data beats required to complete the requested transfer.

Figure 6: 8-Word Cacheline Read (C\_SPLB\_SUPPORT\_BURSTS = 1)

**4-Word Cacheline Write (C\_SPLB\_SUPPORT\_BURSTS = 1)**

PLB V4.6 Cacheline 4-word write transactions are supported by the BRAM Interface Controller. A 4-word Cacheline write is completed in 2 data beats during the Data Phase on the PLB V4.6 bus as shown in Figure 7. All byte lanes are used during Cacheline writes and the starting address must be aligned to the start of the cacheline.

Note that this diagram is for a 64-bit wide PLB and a BRAM Native DWIDTH of 64 bits. The actual data width of the requesting Master and the actual Native Data Width of the BRAM Interface Controller can change the number of data beats required to complete the requested transfer.

Figure 7: 4-Word Cacheline Write (C\_SPLB\_SUPPORT\_BURSTS = 1)

### 8-Word Cacheline Write (C\_SPLB\_SUPPORT\_BURSTS = 1)

PLB V4.6 Cacheline 8-word write transactions are supported by the BRAM Interface Controller. An 8-word Cacheline write is completed in 4 data beats during the Data Phase on the PLB V4.6 bus as shown in Figure 8. All byte lanes are used during Cacheline writes and the starting address must be aligned to the start of the cacheline.

Note that this diagram is for a 64-bit wide PLB and a BRAM Native DWIDTH of 64 bits. The actual data width of the requesting Master and the actual Native Data Width of the BRAM Interface Controller can change the number of data beats required to complete the requested transfer.

Figure 8: 8-Word Cacheline Write (C\_SPLB\_SUPPORT\_BURSTS = 1)

**Fixed Length Burst Read (C\_SPLB\_SUPPORT\_BURSTS = 1)**

PLB V4.6 Fixed Length Burst Read transactions are supported by the BRAM Interface Controller. The transfer length may be 2 to 16 data beats with specified data widths of words, double-words, and quad-words. A 10 Double Word Fixed Length Burst read is shown in **Figure 9**.

Note that this diagram is for a 64-bit wide PLB and a BRAM Native DWIDTH of 64 bits. The actual data width of the requesting Master and the actual Native Data Width of the BRAM Interface Controller can change the number of data beats required to complete the requested transfer.

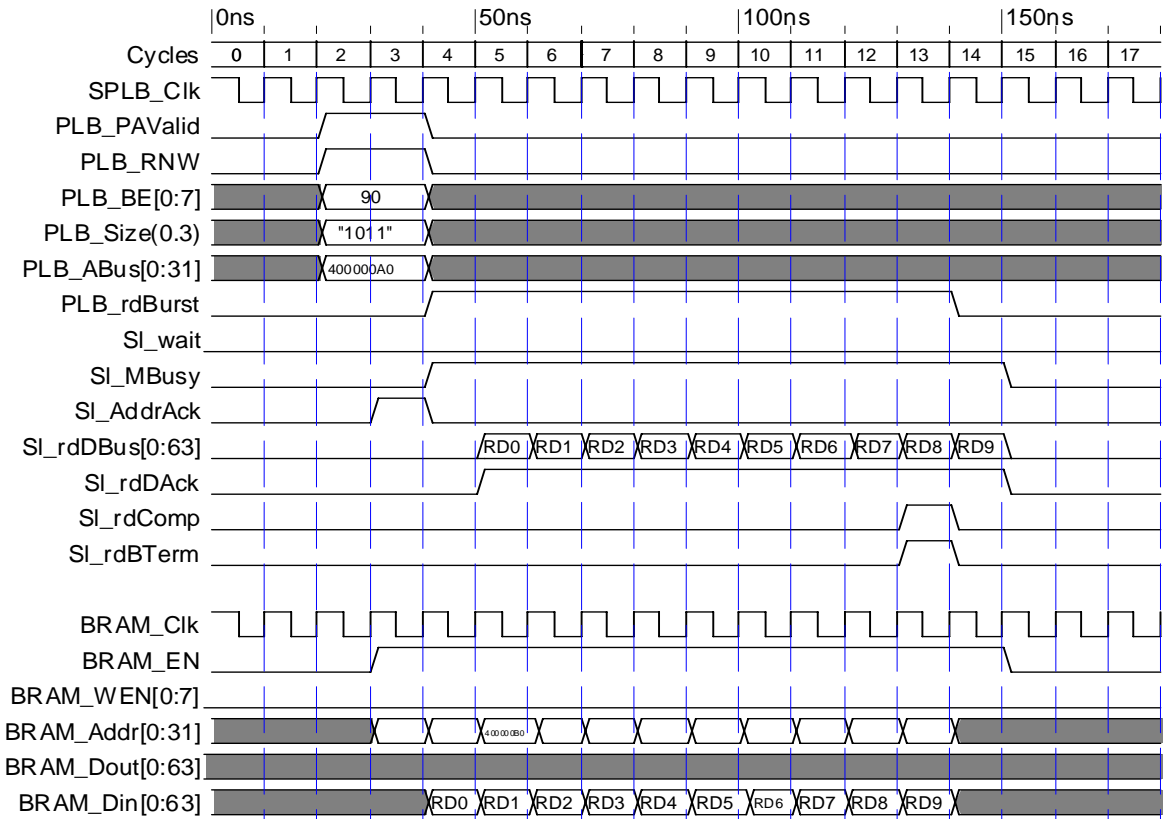

Figure 9: Fixed Length Burst Read (C\_SPLB\_SUPPORT\_BURSTS = 1)

### Fixed Length Burst Write (C\_SPLB\_SUPPORT\_BURSTS = 1)

PLB V4.6 Fixed Length Burst Write transactions are supported by the BRAM Interface Controller. The transfer length may be 2 to 16 data beats with specified data widths of bytes, half-words, words, and double-words. A 12 double word Fixed Length Burst Write is shown in Figure 10.

Note that this diagram is for a 64-bit wide PLB and a BRAM Native DWIDTH of 64 bits. The actual data width of the requesting Master and the actual Native Data Width of the BRAM Interface Controller can change the number of data beats required to complete the requested transfer.

## Design Implementation

### Target Technology

The intended target technology for this design is the Virtex and Spartan FPGAs.

### Device Utilization and Performance Benchmarks

#### Core Performance

To analyze the XPS BRAM Interface Controller timing within the FPGA, a design was generated that enclosed the Core in a wrapper. For sizing estimates, a simple wrapper that connected all I/O to the ports of the wrapper was utilized. For Fmax, the wrapper was modified to incorporate input and output registers on all input and output ports respectively. FPGA performance and resource utilization benchmarks from the synthesis and mapping of the wrappers hosted in a xc5vlx110t-3 device are shown in [Table 8](#).

*Table 7: XPS BRAM Interface Controller FPGA Performance and Resource Utilization Benchmarks*

Target FPGA			Device Resources			f <sub>MAX</sub> (MHz)
C_SPLB_SUPPORT_BURSTS	C_NATIVE_DWIDTH	C_SPLB_DWIDTH	Slices	Slice Flip-Flops	4-input LUTs	f <sub>MAX</sub>
0	32	32		9	25	176
1	32	32		78	131	180
1	64	64		81	184	165
1	128	128		95	248	150

*Table 8: XPS BRAM Interface Controller FPGA Performance and Resource Utilization Benchmarks*

Parameter Values			Device Resources			f <sub>MAX</sub> (MHz)
C_SPLB_SUPPORT_BURSTS	C_NATIVE_DWIDTH	C_SPLB_DWIDTH	Slices	Slice Flip-Flops	4-input LUTs	f <sub>MAX</sub>
0	32	32		9	25	176
1	32	32		78	131	180
1	64	64		81	184	165
1	128	128		95	248	150

### System Performance

To measure the system performance (Fmax) of this core, this core was added to a Virtex-4 system, a Virtex-5 system, and a Spartan-3A system as the Device Under Test (DUT) as shown in [Figure 11](#), [Figure 12](#), and [Figure 13](#).

Because the XPS BRAM Interface Controller core will be used with other design modules in the FPGA, the utilization and timing numbers reported in this section are estimates only. When this core is combined with other designs in the system, the utilization of FPGA resources and timing of the core design will vary from the results reported here.

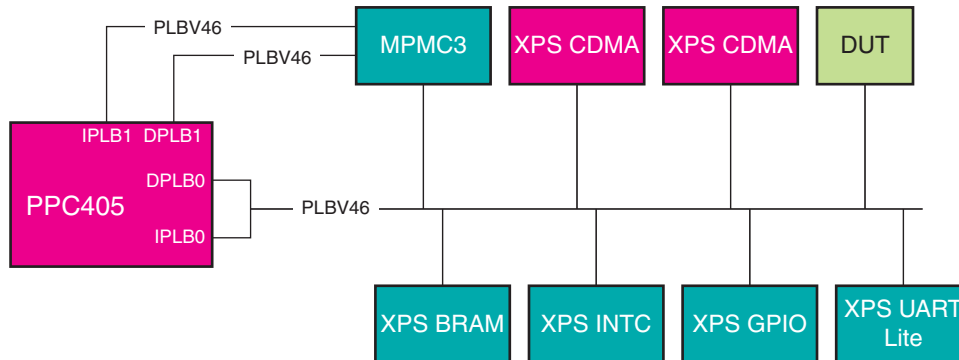

Figure 11: Virtex-4 FX System

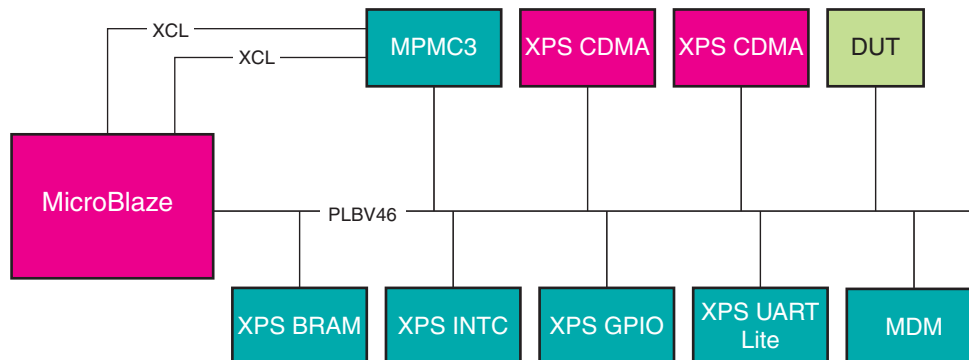

Figure 12: Virtex-5 LX System

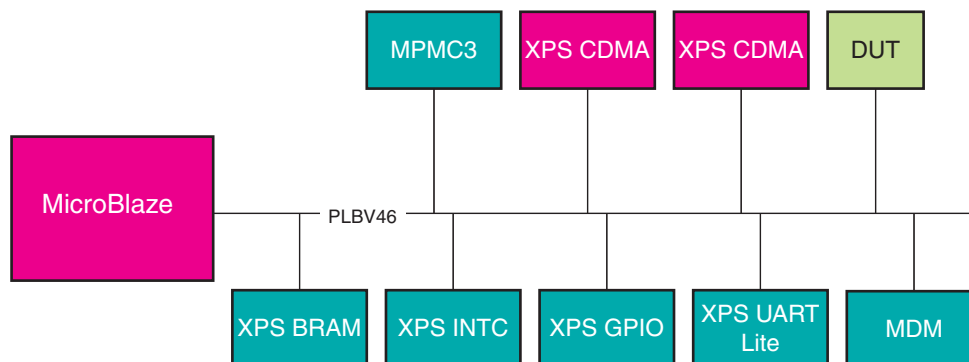

Figure 13: Spartan-3A System

The target FPGA was then filled with logic to drive the LUT and BRAM utilization to approximately 70% and the I/O utilization to approximately 80%. Using the default tool options and the slowest speed grade for the target FPGA, the resulting target FMax numbers are shown in [Table 9](#).

**Table 9: XPS BRAM Interface Controller System Performance**

Target FPGA	Target $f_{MAX}$ (MHz)
S3A700 -4	90
V4FX60 -10	100
V5LXT50 -1	120

The target fMAX is influenced by the exact system and is provided for guidance. It is not a guaranteed value across all systems.

## Specification Exceptions

This design does not support the following PLB V4.6 specification features for Slave devices:

- Address pipelining
- Parity
- Indeterminate Length Bursts
- Cacheline 16 requests
- Fixed length Burst requests longer than 16 data beats

## Revision History

The following table shows the revision history of this document.

Date	Version	Revision
11/16/06	1.0	Initial Xilinx release.

Date	Version	Revision
02/28/07	1.1	Updated timing diagrams for reduced latency operation, removed references to Cacheline 16 support, added resource utilization numbers, Pt to Pt Mode operation description updated, added IBM spec reference.
8/09/07	1.2	In Table 2, C_SPLB_SUPPORT_BURSTS Default Value was 0.
9/26/07	1.3	Added FMax Margin <b>System Performance</b> section.
4/17/08	1.4	Added Automotive Spartan-3A support.
7/25/08	1.5	Added QPro Virtex-4 Hi-Rel and QPro Virtex-4 Rad Tolerant support.
