About this Guide

This document provides basic information on how to start working with the PetaLinux Tools. PetaLinux is an Embedded Linux System Development Kit specifically targeting FPGA-based System-on-Chip designs.

What is PetaLinux

PetaLinux Tools provide a simple and fast method to build and deploy Linux-based software on Xilinx Zynq-7000 APSoC and MicroBlaze devices. With PetaLinux, you can:

- Build and configure Linux components; Linux kernel, u-boot and file system, for Zynq-7000 APSoC and MicroBlaze based designs
- Easily synchronize your Linux software platform and hardware platform in a single step
- Easily target and migrate your Linux user application to Zynq-7000 APSoC or MicroBlaze based Linux platform
- Quickly get started with building Linux-based software on Xilinx and partner development boards using the pre-built Board Support Packages (BSPs)
- Test your Zynq-7000 APSoC or MicroBlaze Linux system without any hardware in a virtual machine environment using QEMU

The following components are included in PetaLinux v2014.2:

- xlnx_3.14 Linux kernel
- xilinx-v2014.1 u-boot
- ARM toolchain of 4.8.1 and MicroBlaze toolchain of 4.8.3
- Prebuilt packages from Yocto 1.6
- Xilinx QEMU 1.4.50

The following sections will get you started with building and booting Linux using PetaLinux tools.

Prerequisites

This getting started document assumes that the following prerequisites have been satisfied:

- You have PetaLinux Tools installed on your Linux workstation. If you haven't installed PetaLinux Tools, please refer to PetaLinux Tools Installation Guide (UG976) to install it.
- A serial communication program such as minicom or kermit has been installed; the baud rate of the serial communication program has been set to 115200bps.
- If you wish to work on hardware designs, Xilinx tools and JTAG cable drivers must be installed. Please refer to Xilinx installation documentation and procedures.
- The reader of this document is assumed to have basic Linux knowledge.
Prerequisites

- Unless otherwise indicated the PetaLinux tool command must be run from within a project directory ("<project-root>").

  For some workflows you may need:

  - A workstation with tftpd server running.
  - A "/tftpboot" directory on your workstation and all users have read/write permissions to it.
Environment Setup

Setup the PetaLinux working environment by running the PetaLinux setup script as follows:

1. Source the set up script. For bash:

```bash
$ source <path-to-installed-PetaLinux>/settings.sh
```

or for C shell:

```bash
$ source <path-to-installed-PetaLinux>/settings.csh
```

**WARNING:**

- Default shell "/bin/sh" is required to be bash.
- Only run one of these scripts - whichever is appropriate for your terminal shell
- You must run the settings script each time you open a new terminal window or shell. The PetaLinux tools will fail otherwise.

2. Verify that the PetaLinux working environment has been set:

```bash
$ echo $PETALINUX
/opt/petalinux-v2014.2-final
```

Environment variable "$PETALINUX" should point to the path to the installed PetaLinux. Your echo output may be different from this example, it depends on where you installed PetaLinux.
Install PetaLinux Reference BSP

PetaLinux Reference BSPs are reference designs for you to start working with and customise for your own projects. These are provided in the form of installable BSP (Board Support Package) files, and include all necessary design and configuration files, including pre-built and tested hardware and software images, ready for download to your board or for booting in the QEMU system simulation environment.

BSP is not included in the PetaLinux installer, you will need to download the BSP from PetaLinux download website.

Below are the steps to install a BSP:

1. Change to the directory under which you want PetaLinux projects to be created. E.g.: I want to create projects under /home/user:

   $ cd /home/user

2. Run petalinux-create command on the command console:

   $ petalinux-create -t project -s <path-to-bsp>

You will see output similar to the following, according to which BSP you are installing:

```
INFO: Create project:
INFO: Projects:
INFO: * Xilinx-ZC702-2014.2
INFO: has been successfully installed to /home/user
INFO: New project successfully created in /home/user
```

In the above example, when the command runs, it tells you what projects has been extracted from the BSP and installed. If you run ls from “/home/user”, you will see the installed projects.

Please refer to section Appendix B: PetaLinux Project Structure for more details on a PetaLinux project.
Test a Pre-built PetaLinux Image

So far, you have successfully installed PetaLinux, one or more PetaLinux projects are created from PetaLinux reference BSP, and setup the PetaLinux working environment. Now, you can try one of the reference designs shipped with your BSP package. This is achieved with the `petalinux-boot` command, with the `-qemu` option to boot reference designs under software simulation (QEMU) and `-jtag` on a hardware board.

Test Pre-Built PetaLinux Image on Hardware

PetaLinux BSPs include pre-built FPGA bitstreams for each reference design, allowing you to quickly boot linux on your hardware.

Boot Pre-built Images from SD Card for Zynq

This section is for Zynq only, since Zynq allows to boot from SD card. Here are the steps on how to boot pre-built images from SD card:

1. Mount your SD card to your host machine.
2. Copy the following files from `<plnx-proj-root>/pre-built/linux/images/` into the root directory of the first partition which is of FAT format of your SD card:
   - `BOOT.BIN`
   - `image.ub`
3. Connect the serial port on the board to your workstation.
4. Open a console on your workstation and then start your preferred serial communication program (e.g. kermit, minicom) with the baud rate set to 115200 on that console.
5. Power off the board.
6. Set the boot mode of the board to SD boot.
7. Plug the SD card into the board.
8. Power on the board.
9. Watch the console. Hit any key to stop autoboot when you see the following message on the console:

    Hit any key to stop autoboot:

10. Type "run sdboot" in the u-boot console to boot Linux from SD card:

    Hit any key to stop autoboot: 0
    U-Boot-PetaLinux> run sdboot
11. Watch the serial console, you will see boot messages which is similar to the following:

```
INIT: version 2.88 booting
Starting Bootlog daemon: bootlogd.
Creating /dev/flash/* device nodes
random: dd urandom read with 6 bits of entropy available
starting Busybox inet Daemon: inetd... done.
Starting uWeb server:
NET: Registered protocol family 10
update-rc.d: /etc/init.d/run-postinsts exists during rc.d purge (continuing)
Removing any system startup links for run-postinsts ... 
/etc/rcS.d/S99run-postinsts
INIT: Entering runlevel: 5
Configuring network interfaces... xemacps e000b000.ps7-ethernet: eth0: no PHY setup
udhcpc (v1.22.1) started
Sending discover...
Sending select for 10.0.2.15...
Lease of 10.0.2.15 obtained, lease time 86400
/etc/udhcpc.d/50default: Adding DNS 10.0.2.3
done.
Stopping Bootlog daemon:
Built with PetaLinux v2014.2 (Yocto 1.6) Xilinx-ZC702-2014.2 /dev/ttyPS0
Xilinx-ZC702-2014.2 login:
```

Figure 1: Serial console output of Zynq SD boot

12. Type user name root and password root on the serial console to log into the PetaLinux system.

**Boot Pre-built Images with JTAG**

You can download the prebuilt images onto the board with JTAG. Here are the steps:

1. Power off the board.
2. Connect the JTAG port on the board with the JTAG cable to your workstation.
3. Connect the serial port on the board to your workstation.
4. Connect the Ethernet port on the board to the local network via a network switch.
5. For Zynq boards, ensure the mode switches are set to JTAG mode. Refer to the board documentation for details.
6. Power on the board.
7. Open a console on your workstation and then start your preferred serial communication program (e.g. kermit, minicom) with the baud rate set to 115200 on that console.
8. Run the petalinux-boot command as follows on your workstation:

```
$ petalinux-boot --jtag --prebuilt 3
```
Test Pre-Built PetaLinux Image on Hardware

The --jtag option tells petalinux-boot to boot on hardware via JTAG, and the --prebuilt 3 boots the linux kernel. This command will take some time to finish, please wait until you see the shell prompt again on the command console.

The figures below are examples of the messages on the workstation command console and on the serial console:

```bash
$ petalinux-boot --jtag --prebuilt 3
INFO: The image provided is a zImage and no addition options were provided
INFO: Append dtb - /home/user/Xilinx-ZC702-2014.2/pre-built/linux/images/system.dtb
and other options to boot zImage
INFO: Configuring the FPGA...
INFO: FPGA configuration completed.
INFO: Downloading FSBL
INFO: FSBL download completed.
INFO: Launching XMD for file download and boot.
INFO: This may take a few minutes, depending on the size of your image.

Figure 2: Workstation console output for successful petalinux-boot

INIT: version 2.88 booting
Starting Bootlog daemon: bootlogd.
Creating /dev/flash/*/ device nodes
random: dd urandom read with 6 bits of entropy available
starting Busybox inet Daemon: inetd... done.
Starting uWeb server:
NET: Registered protocol family 10
update-rc.d: /etc/init.d/run-postinsts exists during rc.d purge (continuing)
Removing any system startup links for run-postinsts ...
/etc/rcS.d/S99run-postinsts
INIT: Entering runlevel: 5
Configuring network interfaces... xemacps e000b000.ps7-ethernet: eth0: no PHY setup
udhcpc (v1.22.1) started
Sending discover...
Sending select for 10.0.2.15...
Lease of 10.0.2.15 obtained, lease time 86400
/etc/udhcpc.d/50default: Adding DNS 10.0.2.3 done.
Stopping Bootlog daemon:
Built with PetaLinux v2014.2 (Yocto 1.6) Xilinx-ZC702-2014.2 /dev/ttyPS0
Xilinx-ZC702-2014.2 login:

Figure 3: Serial console output of petalinux-boot
```

By default, network settings for PetaLinux reference designs are configured using DHCP. The output you see may be slightly different from the above example, depending upon which PetaLinux reference design you test.
9. Type user name root and password root on the serial console to log into the PetaLinux system.

10. Determine the IP address of the PetaLinux by running `ifconfig` on the system console.

Troubleshooting

If your local network does not have a DHCP server, the system will fail to acquire an IP address. If so, refer to Appendix A which describes how to manually specify the address.

If the `petalinux-boot for jtag` command fails, it is typically from a JTAG connectivity failure. Please ensure the board is powered on and your JTAG cable is properly connected. Please refer to the Xilinx JTAG cable and tools documentation for more detailed troubleshooting.

Test Pre-Built PetaLinux Image with QEMU

PetaLinux provides QEMU support such that the PetaLinux software image can be tested in a simulated environment, without any hardware.

To test the PetaLinux reference design with QEMU, follow these steps:

1. Change to your project directory and boot the prebuilt linux kernel image:

   ```
   $ petalinux-boot --qemu --prebuilt 3
   ```

   The `--qemu` option tells `petalinux-boot` to boot QEMU, instead of real hardware via JTAG, and the `--prebuilt 3` boots the linux kernel.

   - The `--prebuilt 1` option performs a Level 1 boot, that is, only configure the FPGA.
   - Level 2 is FPGA + u-boot.
   - Level 3 is FPGA + pre-built Linux image.

   You should see the following kernel boot log on the console:
Test Pre-Built PetaLinux Image with QEMU

INIT: version 2.88 booting
Starting Bootlog daemon: bootlogd.
Creating /dev/flash/* device nodes
random: dd urandom read with 6 bits of entropy available
starting Busybox inet Daemon: inetd... done.
Starting uWeb server:
NET: Registered protocol family 10
update-rc.d: /etc/init.d/run-postinsts exists during rc.d purge (continuing)
Removing any system startup links for run-postinsts ...
  /etc/rcS.d/S99run-postinsts
INIT: Entering runlevel: 5
Configuring network interfaces... xemacps e000b000.ps7-ethernet: eth0: no PHY setup
udhcpc (v1.22.1) started
Sending discover...
Sending select for 10.0.2.15...
Lease of 10.0.2.15 obtained, lease time 86400
/etc/udhcpc.d/50default: Adding DNS 10.0.2.3
done.
Stopping Bootlog daemon:
Built with PetaLinux v2014.2 (Yocto 1.6) Xilinx-ZC702-2014.2 /dev/ttyPS0
Xilinx-ZC702-2014.2 login:

Figure 4: Serial console output of successful petalinux-boot prebuilt

2. Login to PetaLinux with the default user name root and password root.

💡 TIP: To exit QEMU, press Ctrl+A together, release and then press X
Rebuilding the Reference Design Software Image

So far, you have tested the PetaLinux reference design pre-built software image both with QEMU and on hardware. You can also rebuild the reference design. The following subsections describe how to do it and how to test the resulting image.

Compile PetaLinux Reference Design Software

First of all, let's look at how to rebuild the PetaLinux reference design.

1. Run `petalinux-build` to compile the software images:

```bash
$ petalinux-build
```

   This step will generate DTB, first stage bootloader if select, u-boot if selected, kernel, rootfs, and will generate boot images.

2. The compilation progress will show on the console. Wait until the compilation finishes.

   **TIP:**
   - A detailed compilation log will be in "<project-root>/build/build.log" file.

When the build finishes, the generated images will be within the "<project-root>/images" and "/tftpboot" directories.

Here is an example of the compilation progress output:
INFO: Checking component...
INFO: Generating make files and build linux
INFO: Generating make files for the subcomponents of linux
INFO: Building linux
[INFO ] pre-build linux/rootfs/fwupgrade

Figure 5: Compilation progress output
Test New Software Image with QEMU

The final kernel image is the "zImage" for Zynq or "image.elf" for MicroBlaze, living in the "<project-root>/images/linux" folder. A copy is also placed in the "/tftpboot" directory or your development workstation, to support network-based kernel boot.

Test New Software Image with QEMU

Now you have successfully rebuilt the software system image, it is time to test it out.

1. Use `petalinux-boot --qemu` command to test the newly built software image:

   ```bash
   $ petalinux-boot --qemu --kernel
   ```

   The system boot messages will be shown on the console where QEMU is running.

2. When you see the login prompt on the QEMU console, login as `root` with password `root`.

   **TIP:**
   
   • To exit QEMU, press Ctrl+A together, release and then press X

Test New Software Image on Hardware

Next, let's test the rebuilt software image on the real hardware. Follow the instructions from the previous Test Pre-built PetaLinux Image on Hardware section, to connect the board, serial and JTAG correctly.

1. Use `petalinux-boot` to program the FPGA with the reference design pre-built bitstream:

   ```bash
   $ petalinux-boot --jtag --prebuilt 1
   ```

   This command will take a few moments, please wait until you see the shell prompt shows again on the command console.

2. Use `petalinux-boot` to download the built Linux image to the board and boot it:

   ```bash
   $ petalinux-boot --jtag --kernel
   ```

   This command will take a few minutes, downloading the entire kernel image over the JTAG link. Please wait until the shell prompt displays again on the serial console.

3. Watch the serial console, you should see the Linux booting messages shown on the serial console.

You can now repeat the previous steps for connecting to the board via the serial console and the network demo.

For Zynq, you can follow section Boot Pre-built Images from SD Card for Zynq to SD boot the rebuilt images. Instead of using the prebuilt `image.ub`, use the rebuilt one from `<plnx-proj-root>/images/linux/image.ub`. 
Appendix A: IP Address Configuration

IP Address Configuration with ifconfig

After the PetaLinux system boots, you can set or change its IP address manually.

1. First determine which network the PetaLinux system is connected to.
   - If you are booting on real hardware, and the board is connected to a local network, the IP address of the system should be in the subnet of the local network.
   - If you are booting in QEMU, the IP address of the system should be in the QEMU subnet. Refer to the PetaLinux Tools QEMU System Emulation Guide (UG982) for more details.

2. Use ifconfig command to set the systems IP address on the login console:

   ```
   # ifconfig eth0 <IP>
   ```

   e.g:

   ```
   # ifconfig eth0 192.168.10.10
   ```

3. Use ifconfig on the system login console again to confirm whether the IP address has been successfully set:

   ```
   # ifconfig
   ```

   You should be able to see the IP has been set to the interface eth0.
Appendix B: PetaLinux Project Structure

This section provides a brief introduction on a PetaLinux project.
A PetaLinux project is composed of subsystems, we support single Linux system only. A Linux system is composed of the following components:

- device tree
- first stage bootloader (optional)
- u-boot (optional)
- Linux kernel
- rootfs. And the rootfs is composed of the following components:
  - prebuilt packages
  - Linux user applications (optional)
  - Linux user libraries (optional)
  - user modules (optional)

A PetaLinux project directory contains configuration files of the project, the Linux subsystem, and the components of the subsystem. petalinux-build builds the project with those configuration files. User can run petlainux-config to modify them.

Here is an example of a PetaLinux project:

```
<project-root>
  |-.petalinux/
  |-.hw-description/
  |-.config.project
  |-.subsystems/
  |  |-.linux/
  |  |  |-.config
  |  |  |  |-.hw-description/
  |  |  |  |-.configs/
  |  |  |  |  |-.device-tree/
  |  |  |  |  |  |-.ps.dtsi
  |  |  |  |  |  |-.pl.dtsi
  |  |  |  |  |  |-.system-conf.dtsi
  |  |  |  |  |  |-.system-top.dtsi
  |  |  |  |  |-.kernel/
  |  |  |  |  |  |-.config
  |  |  |  |  |-.u-boot/
  |  |  |  |  |  |-.config.mk
  |  |  |  |  |  |-.platform-auto.h
  |  |  |  |  |  |-.platform-top.h
  |  |  |  |  |-.rootfs/
  |  |  |  |  |  |-.config
  |  |  |  |  |-.bootloader/
  |  |  |  |  |  |-.fs-boot/ | zynq_fsbl/
  |  |  |  |  |-.apps/
  |  |  |  |  |  |-.myapp/
```

<td>The following files are auto generated by petalinux-config:</td>
</tr>
<tr>
<td>• config.mk</td>
</tr>
<tr>
<td>• platform-auto.h</td>
</tr>
<tr>
<td>platform-top.h will not be modified by any PetaLinux tools and under full control by user. When u-boot builds, these files will be copied into u-boot build source directory build/linux/u-boot/src/&lt;U_BOOT_SRC&gt;/ as follows:</td>
</tr>
<tr>
<td>• config.mk will be copied to board/xilinx/zynq/ for Zynq and board/xilinx/microblaze-generic/ for MicroBlaze.</td>
</tr>
<tr>
<td>• platform-auto.h and platform-top.h will be copied to include/configs/ directory.</td>
</tr>
</tbody>
</table>

"<project-root>/components/"  

directory for local components. If you don't have local components, this directory is not required.

Components created by petalinux-create will be placed into this directory.

You can also manually copy components into this directory.

Here is the rule to place a local component:

"<project-root>/components/<COMPONENT_TYPE>/<COMPONENT>"

When the project is built, two directories will be auto generated:

• "<project-root>/build" for the files generated for build
• "<project-root>/images" for the bootable images
Here is an example:

```
<project-root>
  |-.petalinux/
  |-.hw-description/
  |-.config.project
  |-.subsystems/
    |-.linux/
    |-.config
    |-.hw-description/
    |-.configs/
    |-.device-tree/
    |-.kernel/
    |-.u-boot/
    |-.rootfs/
  |-.components/
    |-.apps/
    |-.myapp/
  |-.build/
    |-.build.log
    |-.linux/
    |-.rootfs/
    |-.device-tree/
    |-.kernel/
    |-.u-boot/
    |-.rootfs/
    |-.stage/
    |-.apps/
    |-.myapp/
    |-.targetroot/
    |-.stage/
    |-.apps/
    |-.myapp/
  |-.images/
    |-.linux/
```

**WARNING:** "<project-root>/build/" is automatically generated. Don’t manually edit. Contents in this directory will get updated when you run petalinux-config or petalinux-build.

"<project-root>/images/" is automatically generated. Files in this directory will get updated when you run petalinux-build.

</table>

**TIP:** You can have version control over your PetaLinux project directory "<project-root>" excluding the following:

- "<project-root>/.petalinux"
- "<project-root>/.build"
- "<project-root>/.images"
Appendix C: How to Work with External Kernel and U-boot With PetaLinux

PetaLinux includes kernel source and u-boot source. However, you can build your own kernel and u-boot with PetaLinux.

PetaLinux searches for kernel and u-boot candidates from your PetaLinux project components search path. You can get the search path with "petalinux-config --searchpath --print" command:

```
$ petalinux-config --searchpath --print
<plnx-proj-root>/components/:/opt/petalinux-v2014.2-final/components/
```

To make PetaLinux tools detect your kernel and u-boot, you can:

- For kernel, create a `<plnx-proj-root>/components/linux-kernel/` directory, add your kernel source to the created directory `<plnx-proj-root>/components/linux-kernel/<MY-KERNEL>`.
- For u-boot, create a `<plnx-proj-root>/components/u-boot/` directory, add your kernel source to the created directory: `<plnx-proj-root>/components/u-boot/<MY-U-BOOT>`.
- run `petalinux-config`, and go into "linux Components Selection --->" submenu,
- For kernel, select "kernel () --->", it will list your kernel there. E.g.:

  (X) <MY-KERNEL>
  ( ) xlnx-3.14
  ( ) remote

  (X) <MY-U-BOOT>
  ( ) u-boot-plnx
  ( ) remote
  ( ) none

  **WARNING:** PetaLinux u-boot auto config is just tested with the u-boot shipped with PetaLinux, it is not guaranteed to just work with your own u-boot.

- Exit the menu, and save your settings.
- Sometimes, the default kernel config may not work with your kernel, in this case, you will need to:
  - cleanup the kernel build with the following command:
    ```
    $ petalinux-build -c kernel --mrproper
    ```
  - you can run "petalinux-config -c kernel" to configure your kernel, or you can use defconfig of your kernel with the following command:
    ```
    $ petalinux-config -c kernel --defconfig
    ```
You can also put your kernel and u-boot outside your project. E.g., you put your kernel and u-boot to "<EXTERN_SEARCHPATH>/linux-kernel/<MY_KERNEL>" and "<EXTERN_SEARCHPATH>/linux-kernel/<MY_U_BOOT>". You will need to add "<EXTERN_SEARCHPATH>" to the project components searchpath:

```bash
$ petalinux-config --searchpath --prepend <EXTERN_SEARCHPATH>
```

And then when you run petalinux-config, you can see your kernel and u-boot from the kernel/u-boot candidate list.
Appendix D: PetaLinux Tools tools usage

This section provides usage information on PetaLinux Tools tools.

petalinux-create

petalinux-create (c) 2005-2013 Xilinx, Inc.

This command creates a new PetaLinux Project or component

Usage:
   petalinux-create [options] -t|--type <TYPE> -n|--name <COMPONENT_NAME>

Required:
- t, --type <TYPE> Available type:
  * project
  * apps
  * libs
  * modules
  * generic

- n, --name <COMPONENT_NAME> specify a name for the component or project. It is OPTIONAL to create a PROJECT. If you specify source BSP when you create a project, you are not required to specify the name.

Options:
- p, --project <PROJECT> specify full path to a PetaLinux project this option is NOT USED for PROJECT CREATION. default is the working project.

--force force overwriting an existing component directory.

-h, --help show function usage

--enable this option applies to all types except project. enable the created component

Options for project:
- template <TEMPLATE> zynq|microblaze default is zynq.
- s|--source <SOURCE> specify a PetaLinux BSP as a project source.
- out <OUTPUT_DIR> diretory to place your project default is your working directory

Options for apps:
- template <TEMPLATE> <c|c++|autoconf|install>
  c : c user application(default)
  c++ : c++ user application
  autoconf: autoconf user application
  install: install data only
- s, --source <SOURCE> valid source name format:
  XXX.tar.gz, XXX.tar.bz2, XXX.tar, XXX.zip, app source directory
Options for libs:
--template <TEMPLATE> <c|c++|autoconf|install-only>
  c : c user library(default)
  c++ : c++ user library
  autoconf: autoconf user library
--priority Library priority (1 to 11, Default is 7)
-s, --source <SOURCE> valid source name format:
  XXX.tar.gz, XXX.tar.bz2, XXX.tar, XXX.zip, lib source directory

Options for modules: (No specific options for modules)

Options for generic: (No specific options for generic)

Example to create projects:
From PetaLinux Project BSP:
  $ petalinux-create -t project -s <PATH_TO_PETALINUX_PROJECT_BSP>
From template:
  $ petalinux-create -t project -n <PROJECT> --template zynq

Example to create apps:
Create an app and enable it:
  $ petalinux-create -t apps -n myapp --enable
The application "myapp" will be created with c template in:
  <PROJECT>/components/apps/myapp/

Example to create libs:
Create an lib and enable it:
  $ petalinux-create -t libs -n mylib --enable
The library "mylib" will be created with c template in:
  <PROJECT>/components/libs/mylib/

Example to create modules:
Create an lib and enable it:
  $ petalinux-create -t modules -n mymodule --enable
The library "mymodule" will be created with template in:
  <PROJECT>/components/modules/mymodule/
INFO: Checking component...
Configures the project or the specified component with menuconfig.

Usage:
petalinux-config [options] {--component <COMPONENT> |\n--get-hw-description[=SRC] |--searchpath <--ACTION> [VALUE]}

Options:
-h, --help show function usage
-p, --project <PROJECT> path to PetaLinux Tools project.
    default is the working project
--oldconfig takes the working configuration
-c, --component <COMPONENT> Specify the component
If no component is specified, it will do
top level subsystem configuration only
all: to configure the whole project
If you specify other component, it will
configure that component
E.g. -c rootfs

--get-hw-description[=SRC] get hardware description.
if [SRC] is specified, look in that
location for an XSDK BSP project.
Otherwise, this MUST be run from
WITHIN an XSDK PetaLinux BSP project.

--searchpath edit project search path

Available project user searchpath actions:
--prepend <SEARCHPATH> prepend <SEARCHPATH> to project external searchpath
--append <SEARCHPATH> append <SEARCHPATH> to project external searchpath
--replace <SEARCHPATH> replace project user searchpath with <SEARCHPATH>
--print print full project search path
--delete delete project external searchpath

Available Components of linux for this command:
* kernel # is of linux-kernel type
* rootfs  # is of rootfs type

Examples to edit searchpath:
Default PetaLinux tools will look into <PROJECT>/components/ first and then
${PETALINUX}/components/ for components
Prepend external searchpath:
$ petalinux-config --searchpath --prepend <EXTERN_SEARCHPATH0>
the components searchpath will become:
<PROJECT>/components:<EXTERN_SEARCHPATH0>:${PETALINUX}/components/
Append external searchpath:
$ petalinux-config --searchpath --append <EXTERN_SEARCHPATH1>
the components searchpath will become:
<PROJECT>/components:<EXTERN_SEARCHPATH0>:<EXTERN_SEARCHPATH1>:${PETALINUX}/components/
Delete external searchpath:
$ petalinux-config --searchpath --delete
the components searchpath will become:
<PROJECT>/components:${PETALINUX}/components/
Examples to sync hardware description:

Sync hardware description from XSDK PetaLinux BSP project:

```bash
$ cd <XSDK_PLNX_BSP>
$ petalinux-config --get-hw-description
```

It will sync up the DTS, the xparameters.h and the config.mk from <XSDK_PLNX_BSP> to subsystems/linux/hw-description/ directory.

Sync hardware description inside PetaLinux project but outside XSDK PetaLinux BSP project:

```bash
$ petalinux-config --get-hw-description=<XSDK_PLNX_BSP>
```

Examples to configure PetaLinux project:

Configure subsystem level configuration:

```
$ petalinux-config
```

Configure kernel:

```
$ petalinux-config -c kernel
```

Configure rootfs:

```
$ petalinux-config -c rootfs
```
petalinux-build

petalinux-build (c) 2005-2013 Xilinx, Inc.

INFO: Checking component...
Builds the project or the specified components.

Usage:
petalinux-build [options]

Required:

Options:
-h, --help show function usage
-p, --project <PROJECT> path to PetaLinux Tools project.
Default is working project.
-c, --component <COMPONENT> Specify the component
all: to build the whole project
If you specify other component, it will
build that component
E.g. -c rootfs
E.g. -c rootfs/myapp
If you use -c with --help option, it will
show you subcomponents.
E.g. -c rootfs --help shows subcomponents
of rootfs.
-x, --execute <GNU_MAKE_TARGET> Specify a GNU make command of the component
--makeenv <MAKE ENV> Pass GNU make environment variables
-v, --verbose Show compile messages verbose mode

Available Components for linux:
* kernel # is of linux-kernel type
* u-boot # is of u-boot type
* rootfs # is of rootfs type

Available make target for linux:
Quick reference for various supported build targets for linux.

-----------------------------------------------
clean clean out build objects
distclean clean out build
all build subsystem and generate final image
build build subsystem
build_hw-description build hw-description
install_hw-description install dtb to subsystem images directory
install install built objects to target subsystem host copy
package combine target file system and kernel into final image

Examples:
Build the project:
$ petalinux-build
It is the same as "petalinux-build -c all"
the bootable images are in <PRJOECT>/images/linux/.
Build kernel only:
$ petalinux-build -c kernel
Build kernel and update the bootable images:
$ petalinux-build -c kernel
$ petalinux-build -x package
<table>

</table>
petalinux-boot

petalinux-boot with --jtag Option

petalinux-boot (c) 2005-2013 Xilinx, Inc.

This command boots the MicroBlaze/Zynq systems with Petalinux images through JTAG/QEMU.

Usage:
petalinux-boot --qemu|--jtag -c|--component <COMPONENT> [options]

Required:
   --jtag|--qemu         JTAG/QEMU boot mode

Options:
   --prebuilt <BOOT_LEVEL>  Boot prebuilt images (override all settings).
                             supported boot level 1 to 3
                             1 - download FPGA bitstream (and FSBL for Zynq)
                             2 - Boot U-Boot only
                             3 - Boot Linux Kernel only

   --boot-addr <BOOT_ADDR>  boot address

   -i, --image <IMAGE>     image to boot
                             boot images/linux/u-boot.elf image
                             if --kernel is specified, --uboot will not take
                             effect.

   --uboot                  boot images/linux/zImage for Zynq
                             boot images/linux/image_elf for MicroBlaze
                             if --kernel is specified, --uboot will not take
                             effect.

   -v, --verbose           output debug messages
   -h|--help               Display help messages

JTAG available options:
   --load-addr <LOADADDR>   address to load the image
   --regdata <REGDATA>      register data
   --extra-xmd "EXTRA_CMD"  extra XMD command to run before loading the
                             image, can be repeated
   E.g. -x "debugconfig -reset_on_run disable"

   --xmd-conn "CONNECT_CMD"  customised XMD connect command, can be repeated
   E.g. --xmd-connect "connect mb mdm"

   --tcl TCL_OUTPUT         dump XMD commands to the specified file

   --targetcpu <TARGET_CPU>  specify target CPUID (0 to N-1)
   --fpga                   Programs the hardware with the specified
                             bitstream. If not specified, it will use
                             the pre-built bitstream.

   --bitstream [BITSTREAM]  Programs the hardware with the specified
                             bitstream.

Example to download prebuilt bitstream (and FSBL for zynq) to target board:
   $ petalinux-boot --jtag --prebuilt 1

Example to boot prebuilt u-boot on target board:
   $ petalinux-boot --jtag --prebuilt 2
   It will download the prebuilt bitstream (and FSBL for zynq) to target board,
   and then boot prebuilt u-boot on target board.
Example to boot prebuilt kernel on target board:
$ petalinux-boot --jtag --prebuilt 3
For microblaze, it will download the prebuilt bitstream to target board, and then boot the prebuilt kernel image on target board.
For Zynq, it will download the prebuilt bitstream and FSBL to target board, and then boot the prebuilt u-boot and then the prebuilt kernel on target board.

Example to download a bitstream to target board:
$ petalinux-boot --jtag --fpga --bitstream <BITSTREAM>

Example to download newly built u-boot to target board:
$ petalinux-boot --jtag --uboot
It will download <PROJECT>/images/linux/u-boot.elf on target board.

Example to download newly built kernel to target board:
$ petalinux-boot --jtag --kernel
For MicroBlaze, it will download <PROJECT>/images/linux/image.elf on target board.
For Zynq, it will download <PROJECT>/images/linux/system.dtb and <PROJECT>/images/linux/zImage on target board.
petalinux-boot with --qemu Option

petalinux-boot (c) 2005-2013 Xilinx, Inc.

This command boots the MicroBlaze/Zynq systems with Petalinux images through JTAG/QEMU.

Usage:
petalinux-boot --qemu|--jtag -c|--component <COMPONENT> [options]

Required:
--jtag|--qemu JTAG/QEMU boot mode

Options:
--prebuilt <BOOT_LEVEL> Boot prebuilt images (override all settings).
supported boot level 1 to 3
1 - download FPGA bitstream (and FSBL for Zynq)
2 - Boot U-Boot only
3 - Boot Linux Kernel only

--boot-addr <BOOT_ADDR> boot address
--image <IMAGE> image to boot
--uboot boot images/linux/u-boot.elf image
if --kernel is specified, --uboot will not take effect.
--kernel boot images/linux/zImage for Zynq
boot images/linux/image.elf for MicroBlaze
if --kernel is specified, --uboot will not take effect.

-v, --verbose output debug messages
-h|--help Display help messages

QEMU available options:
--dtb DTB force use of a particular device tree file.
if not specified, QEMU uses <PROJECT>/images/linux/system.dtb

--dhcpd enable|disable enable or disable dhcpd. This option applies for ROOT MODE ONLY.
default is to enable dhcpd.

--iptables-allowed whether to allow to implement iptables commands. This option applies for ROOT MODE ONLY.
Default is not allowed.

--net-intf NET_INTERFACE network interface on the host to bridge with the QEMU subnet. This option applies for ROOT MODE ONLY. Default is eth0.

--subnet SUBNET subnet_gateway_ip/num_bits_of_subnet_mask
subnet gateway IP and the number of valid bits of network mask. This option applies for ROOT MODE ONLY. Default is 192.168.10.1/24

--root QEMU as root (ROOT MODE).

Example to boot prebuilt u-boot with QEMU:
$ petalinux-boot --jtag --prebuilt 2

Example to boot prebuilt kernel with QEMU:
$ petalinux-boot --jtag --prebuilt 3

Example to download newly built u-boot with QEMU:
$ petalinux-boot --jtag --uboot
It will boot <PROJECT>/images/linux/u-boot.elf with QEMU.
Example to download newly built kernel to target board:

```bash
$ petalinux-boot --jtag --kernel

For MicroBlaze, it will boot <PROJECT>/images/linux/image.elf with QEMU.
For Zynq, it will boot <PROJECT>/images/linux/zImage with QEMU.
```
This command packages various image format, firmware, prebuilt and bsps

Usage:
```
petalinux-package --boot|--bsp|--firmware|--image|--prebuilt [options]
```

Required:
```
--boot|--bsp|--firmware|--image|--prebuilt
```

<table>
<thead>
<tr>
<th>Various package mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td>boot: packages a boot.bin for Zynq</td>
</tr>
<tr>
<td>bsp: packages a bsp</td>
</tr>
<tr>
<td>firmware: creates a firmware package used by PetaLinux firmware upgrade demo app to upgrade firmwares.</td>
</tr>
<tr>
<td>image: package various image type</td>
</tr>
<tr>
<td>prebuilt: package images to prebuilt</td>
</tr>
</tbody>
</table>

Options:
```
-h|--help
```

Display help messages

Please specify a package mode option for the detailed options

Show package boot options:
```
$ petalinux-package --boot --help
```

Show package bsp options:
```
$ petalinux-package --bsp --help
```

Show package firmware options:
```
$ petalinux-package --firmware --help
```

Show package image options:
```
$ petalinux-package --image --help
```

Show package prebuilt options:
```
$ petalinux-package --prebuilt --help
```
Required option for boot image package:
--fsbl <FSBL_ELF> Path to FSBL ELF image location

Options for boot image package:
--force Force overwrite the boot binary image
--fpga <BITSTREAM> Path to FPGA bitstream image location
--uboot[=<UBOOT_IMG>] Path to the u-boot elf image location
  (default <PROJECT>/images/linux/u-boot.elf)
-o, --output <PKGNAME> Generated boot image name
-p, --project <PROJECT> PetaLinux Tools project location.
  Default is the working project.

Example to package BOOT.BIN for Zynq:
$ petalinux-package --boot --fsbl <FSBL_ELF> --fpga <BITSTREAM> --uboot
It will generate a BOOT.BIN in your working directory with:
  * specified <BITSTREAM>
  * specified <FSBL_ELF>
  * newly built u-boot image which is <PROJECT>/images/linux/u-boot.elf

Required options for BSP packaging:
-o, --output <BSP_NAME> BSP package name - <BSP_NAME>.bsp
-p, --project <PROJECT> PetaLinux projects path to be included in BSP (allow multiple).

Options for BSP packaging:
--force Force overwrite the BSP
--clean Force clean hardware project
--hwsource <PATH_TO_HW> Include a hardware source
--no-extern Exclude external components
  If this option is enabled, you can only rebuild the BSP if the BSP is installed in machine which can see the external component search path.
--no-local Exclude local components
  If the option is enabled, you may not be able to build the BSP since the components placed in your project will not be included in the BSP. You may want this option if you don’t want to expose your local components.
Example to package BSP with a PetaLinux project:

```
$ petalinux-package --bsp -p <PATH_TO_PROJECT> --output MY.BSP
```

It will generate MY.BSP including:
* `<PROJECT>/hw-description/`
* `<PROJECT>/config.project`
* `<PROJECT>/petalinux/`
* `<PROJECT>/subsystems/`
* `<PROJECT>/pre-built/`
* all selected components

from the specified project.

Example to package BSP with hardware source:

```
$ petalinux-package --bsp -p <PATH_TO_PROJECT> \
--hwsource <PATH_TO_HARDWARE_PROJECT> --output MY.BSP
```

It will not modify the specified PetaLinux project `<PATH_TO_PROJECT>`. It will put the specified hardware project source to `<PROJECT>/hardware/` inside MY.BSP archive.

Example to package BSP excluding local components:

```
$ petalinux-package --bsp -p <PATH_TO_PROJECT> --output MY.BSP --no-local
```

It will not include any local component in `<PROJECT>/components` directory, however, it will not change the configuration file, that is, it is possible that you may fail to rebuild the project from MY.BSP.

Example to package BSP excluding extern components:

```
$ petalinux-package --bsp -p <PATH_TO_PROJECT> --output MY.BSP --no-extern
```

It will not include any extern component in user specified components searchpaths. However, it will not change the configuration file, that is, it is possible that you may fail to rebuild the project from MY.BSP.
### Required options for firmware packaging:

#### Options for firmware packaging:

- `-o`, `--output` `<PKGNAME>`
  - Output firmware package name
  - (default firmware.tar.gz)

- `-p`, `--project` `<PROJECT>`
  - Path to PetaLinux project.
  - (default current project)

- `--linux[=<UBIMAGE>]`
  - Update linux kernel image partition with UBIMAGE.
  - (default images/image.ub)

- `--dtb[=<DTBFILE>]`
  - Update DTB partition with specified DTBFILE
  - (default system.dt)

- `--fpga` `<BITSTREAM>`
  - Update FPGA image partition with bitstream

- `--uboot[=<UBOOT_S>]`
  - Update u-boot partition with UBOOT_S
  - (default images/u-boot-s.bin)

- `--bootbin[=<BOOT.BIN>]`
  - Update boot partition with BOOT.BIN
  - (default images/BOOT.BIN) (Arm only)

- `--jffs2[=<JFFS2IMG>]`
  - Update JFFS2 partition with JFFS2IMG
  - (default images/jffs2.img)

- `-a`, `--add` dev:file
  - Update flash partition "dev" with "file", can be repeated.
  - E.g. `-a /dev/flash/fpga:<path-to-fpga-bin>

- `--flash` FLASH_TYPE
  - Flash type(spi, parallel. default is "parallel")

- `--little-endian`
  - Specify the system is a little endian system.
  - E.g. AXI system is little endian.
  - It can be 8 bits, 16 bits or 32 bits.

- `--big-endian`
  - Specify the system is a big endian system.
  - E.g. PLB system is big endian.

- `--data-width <8|16|32>`
  - Specify the data width of the Parallel Flash.
  - Only valid if the target system is little endian.

- `--product` `<PRODUCT_STRING>`
  - Specify additional compatible product strings

- `--pre` SCRIPT
  - Run SCRIPT on target prior to firmware upgrade

- `-v`, `--verbose`
  - Verbose mode

The `--image`, `--dtb`, `--uboot` and `--jffs2` options allow to override the default filenames and partitions using the partition:file syntax of the `--add` option.

For example:

```bash
Install the image.ub file into the flash partition safe-image:
$ petalinux-package --firmware -a /dev/flash/safe-image:/path/to/image.ub

Install the uboot-s.bin file into the flash partition safe-boot:
$ petalinux-package --firmware -a /dev/flash/safe-boot:/path/to/u-boot-s.bin
```

Example to package firmware with BOOT.BIN and kernel image for Zynq:

```bash
$ petalinux-package --firmware --bootbin=<BOOT_BIN> --linux
```

Example to package firmware with bistream, u-boot and kernel image for microBlaze:

```bash
$ petalinux-package --firmware --fpga <BITSTREAM> --uboot --linux
```

It will create firmware.tar.gz archive in your working directory including:
- specified <BITSTREAM>
- <PROJECT>/images/linux/u-boot-s.bin
- <PROJECT>/images/linux/image.ub
Options for prebuilt:
  -p, --project <PROJECT>  PetaLinux Tools project.
  Default is the working project.
  --force                   Force update the pre-built folder
  --clean                   Clean pre-built directory (remove any files).
  --fpga <BITSTREAM>        FPGA bitstream
  -a, --add src:dest        Add file/folder to prebuilt directory
                              "src" with "dest"

Example to package prebuilt images:
$ petalinux-package --prebuilt
It will create a pre-built/ directory in <PROJECT>/, and copy the following files from <PROJECT>/images to <PROJECT>/pre-built/linux/images/ directory:
  * images.ub
  * system.dtb
  * u-boot.elf
  * image.elf
  * System.map.linux
  * u-boot-s.bin
  * zImage (For zynq only)
  * zynq_fsbl.elf (If it is there for zynq only)
  * BOOT.BIN (If it is there for zynq only)

Example to package prebuilt images and specified bitstream:
$ petalinux-package --prebuilt --prebuilt --fpga <BITSTREAM>
Besides copying the images, it will copy the bitstream to
<PROJECT>/pre-built/linux/implentation/

Example to package prebuilt images and add myfile to prebuilt:
$ petalinux-package --prebuilt --prebuilt -a myfile:images/myfile
Besides copying the images, it will copy myfile to
<PROJECT>/pre-built/linux/images/myfile
petalinux-util (c) 2005-2013 Xilinx, Inc.

This command provides the misc utilities.

Usage:
petalinux-util --gdb | --jtag-logbuf | --update-sdcard |--webtalk <on|off> [options]

Required:
--gdb | --jtag-logbuf | --update-sdcard |--webtalk

Various utilities.
gdb: petalinux gdb debug wrapper
jtag-logbuf: prints kernel early printk
with JTAG.
update-sdcard: updates the contents of
SD card.
webtalk: Enable or disable webtalk

Options:
-h|--help Display help messages
Please specify a package mode option for the detailed options
Show gdb util options:
$ petalinux-util --gdb --help
Show jtag-logbuf util options:
$ petalinux-util --jtag-logbuf --help
Show update-sdcard util options:
$ petalinux-util --update-sdcard --help
Show webtalk util options:
$ petalinux-util --webtalk --help

Required options for JTAG logbuf:
-i, --image <IMAGE> kernel ELF image
For MicroBlaze/ARM - PetaLinux image
(vmlinux or image.elf).

Available options for JTAG logbuf:
-p, --project specify a PetaLinux project (ARM only)
-v, --verbose show all the outputs
--noless do not pipe the output to less when in a terminal

Required options for update-sdcard:
-d, --dir <boot:rootfs> SD device mount point. First argument is
the boot partition mount point and the
rootfs partition mount point for rootfs
at least one mount point must be provided
Note: ROOT mode is required for rootfs setup

Available option for update-sdcard:
-p, --project PROJECT specify a PetaLinux reference project
Example to update SD card:

```
$ petalinux-util --update-sdcard --dir /mnt/vfat
```

It will copy BOOT.BIN and image.ub from `<PROJECT>/images/linux/` to `/mnt/vfat`. The `/mnt/vfat` is the SD device mount point.

Example to update boot partition and rootfs partition in SD card:

```
$ petalinux-util --update-sdcard --dir /mnt/vfat:/mnt/rootfs
```

It will require sudo permission.

It will copy BOOT.BIN and image.ub from `<PROJECT>/images/linux/` to `/mnt/vfat` and `<PROJECT>/build/linux/rootfs/targetroot/` to `/mnt/rootfs`. `/mnt/rootfs` is the SD device mount point. It needs to be ext2 and above for rootfs.

Required options for `update-sdcard`:

```
-d, --dir <boot:rootfs> SD device mount point. First argument is the boot partition mount point and the rootfs partition mount point for rootfs at least one mount point must be provided
```

Note: ROOT mode is required for rootfs setup

Available option for `update-sdcard`:

```
-p, --project PROJECT specify a PetaLinux reference project
```

Example to update SD card:

```
$ petalinux-util --update-sdcard --dir /mnt/vfat
```

It will copy BOOT.BIN and image.ub from `<PROJECT>/images/linux/` to `/mnt/vfat`. The `/mnt/vfat` is the SD device mount point.

Example to update boot partition and rootfs partition in SD card:

```
$ petalinux-util --update-sdcard --dir /mnt/vfat:/mnt/rootfs
```

It will require sudo permission.

It will copy BOOT.BIN and image.ub from `<PROJECT>/images/linux/` to `/mnt/vfat` and `<PROJECT>/build/linux/rootfs/targetroot/` to `/mnt/rootfs`. `/mnt/rootfs` is the SD device mount point. It needs to be ext2 and above for rootfs.

Available options for Webalk:

```
petalinux-util --weblalk on enable weblalk feature
patalinux-util --weblalk off disable weblalk feature
```
