Revision History

The following table shows the revision history for this document.

Date	Version	Revision
11/07/2012	1.0	Initial Xilinx release.
01/23/2013	2.0	Updated for ISE® Design Suite 14.4 and Vivado® Design Suite 2012.4.
07/10/2013	3.0	Updated for Vivado® Design Suite 2013.2. Updated Extracting the Project Files , Launching the Vivado Design Suite Software, page 14, Starting the SuperClock-2 Module , and Creating the GTX IBERT Core for the latest procedures.
11/06/2013	4.0	Updated for Vivado Design Suite 2013.3. Device number was corrected from XC7V485T to XC7VX485T. Updated most figures in Chapter 1, VC7203 IBERT Getting Started Guide . The ZIP project file name changed to <code>rdf0272-vc7203-ibert-2013-3.zip</code> . In Figure 1-11 , <i>Digilent JTAG cable</i> changed to <i>Xilinx TCF agent</i> . Figure 1-30 was renamed <i>Design Sources File Hierarchy</i> . Figure 1-31 , <i>Synthesize Out-Of-Context Module</i> was deleted. Updated Appendix A, Additional Resources links.
12/18/2013	5.0	Updated for Vivado Design Suite 2013.4. Updated Figure 1-10 through Figure 1-15 , Figure 1-17 , Figure 1-19 , Figure 1-20 , Figure 1-23 , and Figure 1-27 .
04/16/2014	6.0	Updated for Vivado Design Suite 2014.1. File lists changed under Extracting the Project Files . The ZIP project file name changed to <code>rdf0272-vc7203-ibert-2014-1.zip</code> . The Demonstration Design of the last row of Table 1-1 changed to <code>led_scroll.bit</code> . <i>Launching the Vivado Design Suite Software</i> was changed to Setting Up the Vivado Design Suite . The procedure in Starting the SuperClock-2 Module was updated. In step 6 , page 24 , <i>Add (+)</i> was changed to <i>Add Link</i> . The section In Case of RX Bit Errors was added. Updated 19 figures from Figure 1-10 through Figure 1-35 , including adding Figure 1-31 , Project Manager Window and Figure 1-35 , <i>Bitstream Generation Completed</i> .

Date	Version	Revision
06/12/2014	7.0	Updated for Vivado Design Suite 2014.2. Updated Figure 1-10 through Figure 1-12 , Figure 1-15 , Figure 1-17 , Figure 1-19 , Figure 1-20 , Figure 1-23 , Figure 1-27 , Figure 1-33 , and Figure 1-35 . Updated Viewing GTX Transceiver Operation .
10/08/2014	8.0	Updated for Vivado Design Suite 2014.3. The ZIP project file name changed to rdf0272-vc7203-ibert-2014-3.zip. Updated In Case of RX Bit Errors , page 25. Updated Figure 1-10 , Figure 1-11 , Figure 1-19 , Figure 1-21 through Figure 1-27 , Figure 1-29 , Figure 1-33 , and Figure 1-34 . The demonstration design in the last row of Table 1-1 changed to LED Scroll. C_USER_SCAN_CHAIN* changed from 2 to 3 in Figure 1-33 . The path for the bitstream changed in step 19 , page 41.

VC7203 IBERT Getting Started Guide

Overview

This document provides a procedure for setting up the VC7203 Virtex®-7 FPGA GTX Transceiver Characterization Board to run the Integrated Bit Error Ratio Test (IBERT) demonstration using the Vivado® Design Suite. The designs that are required to run the IBERT demonstration are stored in a Secure Digital (SD) memory card that is provided with the VC7203 board. The demonstration shows the capabilities of the Virtex-7 XC7VX485T FPGA GTX transceiver.

The VC7203 board is described in detail in *VC7203 Virtex-7 FPGA GTX Transceiver Characterization Board User Guide* (UG957) [Ref 1].

The IBERT demonstrations operate one GTX Quad at a time. The procedure consists of:

1. [Setting Up the VC7203 Board, page 8](#)
2. [Extracting the Project Files, page 9](#)
3. [Connecting the GTX Transceivers and Reference Clocks, page 10](#)
4. [Configuring the FPGA, page 15](#)
5. [Setting Up the Vivado Design Suite, page 16](#)
6. [Starting the SuperClock-2 Module, page 19](#)
7. [Viewing GTX Transceiver Operation, page 25](#)
8. [Closing the IBERT Demonstration, page 26](#)

Requirements

The hardware and software required to run the GTX IBERT demonstrations are:

- VC7203 Virtex-7 FPGA GTX Transceiver Characterization Board including:
 - One SD card containing the IBERT demonstration designs
 - One Samtec BullsEye cable
 - Eight SMA female-to-female (F-F) adapters
 - Six 50Ω SMA terminators
 - GTX transceiver power supply module (installed on board)
 - SuperClock-2 module, Rev 1.0 (installed on board)
 - 12V DC power adapter
 - USB cable, standard-A plug to Micro-B plug
- Host PC with:
 - SD card reader
 - USB ports
- Vivado Design Suite software 2014.3

The hardware and software required to rebuild the IBERT demonstration designs are:

- PC with a version of the Windows operating system supported by Xilinx Vivado Design Suite
- Vivado Design Suite software 2014.3

Setting Up the VC7203 Board

This section describes how to set up the VC7203 board.

Caution! The VC7203 board can be damaged by electrostatic discharge (ESD). Follow standard ESD prevention measures when handling the board.

When the VC7203 board ships from the factory, it is configured for the GTX IBERT demonstrations described in this document. If the board has been re-configured it must be returned to the default setup before running the IBERT demonstrations.

1. Move all jumpers and switches to their default positions. The default jumper and switch positions are listed in *VC7203 Virtex-7 FPGA GTX Transceiver Characterization Board User Guide* (UG957) [Ref 1].
2. Install the GTX transceiver power module by plugging it into connectors J66 and J97.
3. Install the SuperClock-2 module:
 - a. Align the three metal standoffs on the bottom side of the module with the three mounting holes in the SUPERCLOCK-2 MODULE interface of the VC7203 board.
 - b. Using three 4-40 x 0.25 inch screws, firmly screw down the module from the bottom of the VC7203 board.
 - c. On the SuperClock-2 module, place a jumper across pins 2–3 (2V5) of the CONTROL VOLTAGE header, J18, and place another jumper across Si570 INH header J11.
 - d. Screw down a 50Ω SMA terminator onto each of the six unused Si5368 clock output SMA connectors: J7, J8, J12, J15, J16 and J17.

Extracting the Project Files

The Vivado project files required to run the IBERT demonstrations are located in `rdf0272-vc7203-ibert-2014-3.zip` on the SD card provided with the VC7203 board. They are also available online at the [Virtex-7 FPGA VC7203 Characterization Kit documentation website](#).

The ZIP file contains these files:

- BIT files
 - `vc7203_ibert_q113_152.bit`
 - `vc7203_ibert_q114_152.bit`
 - `vc7203_ibert_q115_152.bit`
 - `vc7203_ibert_q116_152.bit`
 - `vc7203_ibert_q117_152.bit`
 - `vc7203_ibert_q118_152.bit`
 - `vc7203_ibert_q119_152.bit`
- Probe files
 - `vc7203_ibert_113_debug_nets.ltx`
 - `vc7203_ibert_114_debug_nets.ltx`
 - `vc7203_ibert_115_debug_nets.ltx`
 - `vc7203_ibert_116_debug_nets.ltx`
 - `vc7203_ibert_117_debug_nets.ltx`
 - `vc7203_ibert_118_debug_nets.ltx`
 - `vc7203_ibert_119_debug_nets.ltx`
- Tcl scripts
 - `add_scm2.tcl`
 - `setup_scm2_156_25.tcl`

The Tcl scripts are used to help merge the IBERT and SuperClock-2 source code (described in [Creating the GTX IBERT Core, page 28](#)) and to set up the SuperClock-2 module to run at 156.25 MHz (described in [Setting Up the Vivado Design Suite, page 16](#)). The debug probes are used by Vivado design tools to properly load the SuperClock-2 VIO core.

To copy the files from the Secure Digital memory card:

1. Connect the Secure Digital memory card to the host computer.
2. Locate the file `rdf0272-vc7203-ibert-2014-3.zip` on the Secure Digital memory card.
3. Unzip the files to a working directory on the host computer.

Running the GTX IBERT Demonstration

The GTX IBERT demonstration operates one GTX Quad at a time. This section describes how to test GTX Quad 115. The remaining GTX Quads are tested following a similar series of steps.

Connecting the GTX Transceivers and Reference Clocks

Figure 1-1 shows the locations for GTX transceiver Quads 113, 114, 115, 116, 117, 118, and 119 on the VC7203 board.

Note: Figure 1-1 is for reference only and might not reflect the current revision of the board.

UG847_c1_01_100813

Figure 1-1: GTX Quad Locations

All GTX transceiver pins and reference clock pins are routed from the FPGA to a connector pad which interfaces with Samtec BullsEye connectors. **Figure 1-2 A** shows the connector pad. **Figure 1-2 B** shows the connector pinout.

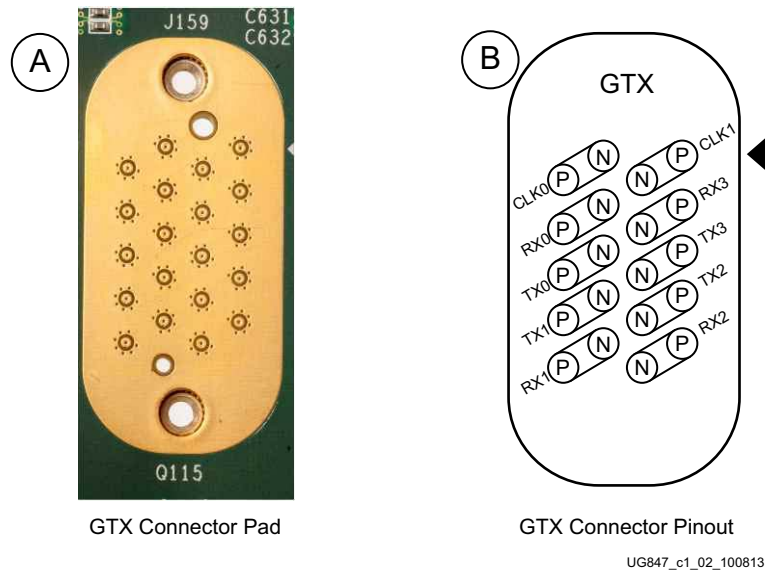

Figure 1-2: A - GTX Connector Pad. B - GTX Connector Pinout

The SuperClock-2 module provides LVDS clock outputs for the GTX transceiver reference clocks in the IBERT demonstrations. **Figure 1-3** shows the locations of the differential clock SMA connectors on the clock module which can be connected to the reference clock cables.

Note: The image in **Figure 1-3** is for reference only and might not reflect the current revision of the board.

Figure 1-3: SuperClock-2 Module Output Clock SMA Locations

The four SMA pairs labeled CLKOUT provide LVDS clock outputs from the Si5368 clock multiplier/jitter attenuator device on the clock module. The SMA pair labeled Si570_CLK provides LVDS clock output from the Si570 programmable oscillator on the clock module.

Note: The Si570 oscillator does not support LVDS output on the Rev B and earlier revisions of the SuperClock-2 module.

For the GTX IBERT demonstration, the output clock frequencies are preset to 156.25 MHz. For more information regarding the SuperClock-2 module, see *HW-CLK-101-SCLK2 SuperClock-2 Module User Guide* (UG770) [Ref 2].

Attach the GTX Quad Connector

Before connecting the BullsEye cable assembly to the board, firmly secure the blue elastomer seal provided with the cable assembly to the bottom of the connector housing if it is not already inserted (see [Figure 1-4](#)).

Note: [Figure 1-4](#) is for reference only and might not reflect the current version of the connector.

UG847_c1_04_100813

Figure 1-4: BullsEye Connector with Elastomer Seal

Attach the Samtec BullsEye connector to GTX Quad 115 ([Figure 1-5](#)), aligning the two indexing pins on the bottom of the connector with the guide holes on the board. Hold the connector flush with the board and fasten it by tightening the two captive screws.

UG847_c1_05_031014

Figure 1-5: BullsEye Connector Attached to Quad 115

GTX Transceiver Clock Connections

See [Figure 1-2](#) to identify the P and N coax cables that are connected to the CLK1 reference clock inputs. Connect these cables to the SuperClock-2 module as follows:

- CLK1_P coax cable → SMA connector J5 (CLKOUT1_P) on the SuperClock-2 module
- CLK1_N coax cable → SMA connector J6 (CLKOUT1_N) on the SuperClock-2 module

Note: Any one of the five differential outputs from the SuperClock-2 module can be used to source the GTX reference clock. CLKOUT1_P and CLKOUT1_N are used here as an example.

GTX TX/RX Loopback Connections

See [Figure 1-2](#) to identify the P and N coax cables that are connected to the four receivers (RX0, RX1, RX2 and RX3) and the four transmitters (TX0, TX1, TX2 and TX3). Use eight SMA female-to-female (F-F) adapters ([Figure 1-6](#)), to connect the transmit and receive cables as shown in [Figure 1-7](#) and detailed here:

- TX0_P → SMA F-F Adapter → RX0_P
- TX0_N → SMA F-F Adapter → RX0_N
- TX1_P → SMA F-F Adapter → RX1_P
- TX1_N → SMA F-F Adapter → RX1_N
- TX2_P → SMA F-F Adapter → RX2_P
- TX2_N → SMA F-F Adapter → RX2_N
- TX3_P → SMA F-F Adapter → RX3_P
- TX3_N → SMA F-F Adapter → RX3_N

Note: To ensure good connectivity, it is recommended that the adapters be secured with a wrench; however, do not over-tighten the SMAs.

UG847_c1_06_100813

UG847_c1_07_031714

Figure 1-7: TX-to-RX Loopback Connection Example

Figure 1-8 shows the VC7203 board with the cable connections required for the Quad 115 GTX IBERT demonstration.

UG847_c1_08_030414

Figure 1-8: Cable Connections for Quad 115 GTX IBERT Demonstration

Configuring the FPGA

This section describes how to configure the FPGA using the SD card included with the board. The FPGA can also be configured through the Vivado Design Suite software using the .bit files and .ltx probe files available on the SD card, or online (as collection rdf0272-vc7203-ibert-2014-3.zip) at the [Virtex-7 FPGA VC7203 Characterization Kit documentation website](#).

To configure from the SD card:

1. Insert the SD card provided with the VC7203 board into the SD card reader slot located on the bottom-side (upper-right corner) of the VC7203 board.
2. Plug the 12V output from the power adapter into connector J2 on the VC7203 board.
3. Connect the host computer to the VC7203 board using a standard-A plug to Micro-B plug USB cable. The standard-A plug connects to a USB port on the host computer and the Micro-B plug connects to U8, the Digilent USB JTAG configuration port on the VC7203 board.
4. Select the GTX IBERT demonstration with the System ACE™ SD controller SYSACE-2 CFG switch, SW8. The setting on this 4-bit DIP switch ([Figure 1-9](#)) selects the file used to configure the FPGA. A switch is in the ON position if set to the far right and in the OFF position if set to the far left. For the Quad 115 GTX IBERT demonstration, set ADR2 = ON, ADR1 = OFF, and ADR0 = ON. The MODE bit (switch position 4) is not used and can be set either ON or OFF.

UG847_c1_09_110112

Figure 1-9: Configuration Address DIP Switch (SW8)

There is one IBERT demonstration design for each GTX Quad on the VC7203 board, for a total of seven IBERT designs. An additional design is provided to demonstrate the USB/UART interface (details of this demonstration are described in the README file on the SD card). All eight designs are organized and stored on the SD card as shown in [Table 1-1](#).

Table 1-1: SD Card Contents and Configuration Addresses

Demonstration Design	ADR2	ADR1	ADR0
GTX Quad 113	ON	ON	ON
GTX Quad 114	ON	ON	OFF
GTX Quad 115	ON	OFF	ON
GTX Quad 116	ON	OFF	OFF
GTX Quad 117	OFF	ON	ON
GTX Quad 118	OFF	ON	OFF

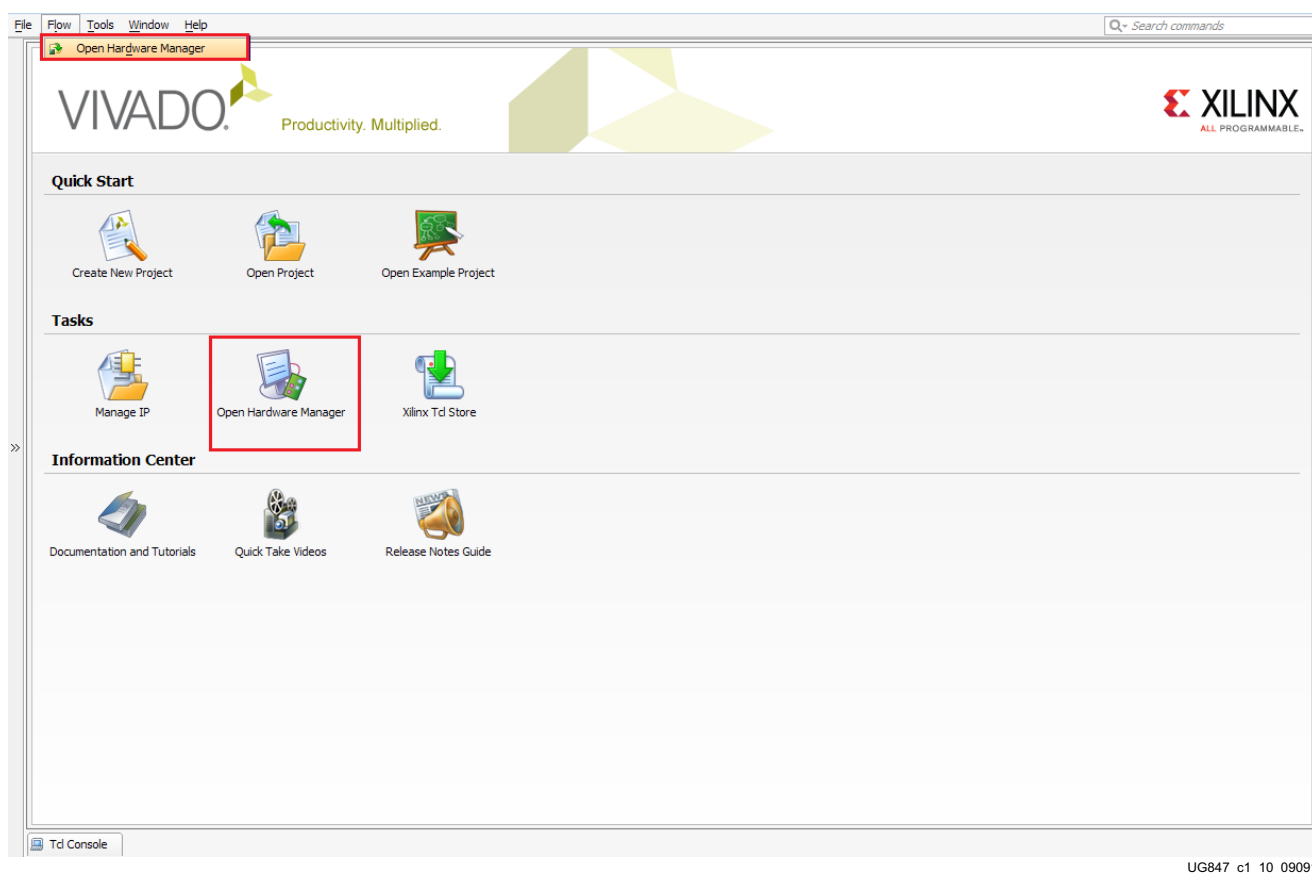

Table 1-1: SD Card Contents and Configuration Addresses (Cont'd)

Demonstration Design	ADR2	ADR1	ADR0
GTX Quad 119	OFF	OFF	ON
LED Scroll	OFF	OFF	OFF

- Place the main power switch SW1 to the ON position.

Setting Up the Vivado Design Suite

- Start Vivado Design Suite on the host computer and click **Flow > Open Hardware Manager** (highlighted in Figure 1-10).

UG847_c1_10_090914

Figure 1-10: Vivado Design Suite, Open Hardware Manager

2. In the Hardware Manager window, click **Open target**, and select the **Open New Target** option (highlighted in Figure 1-11).

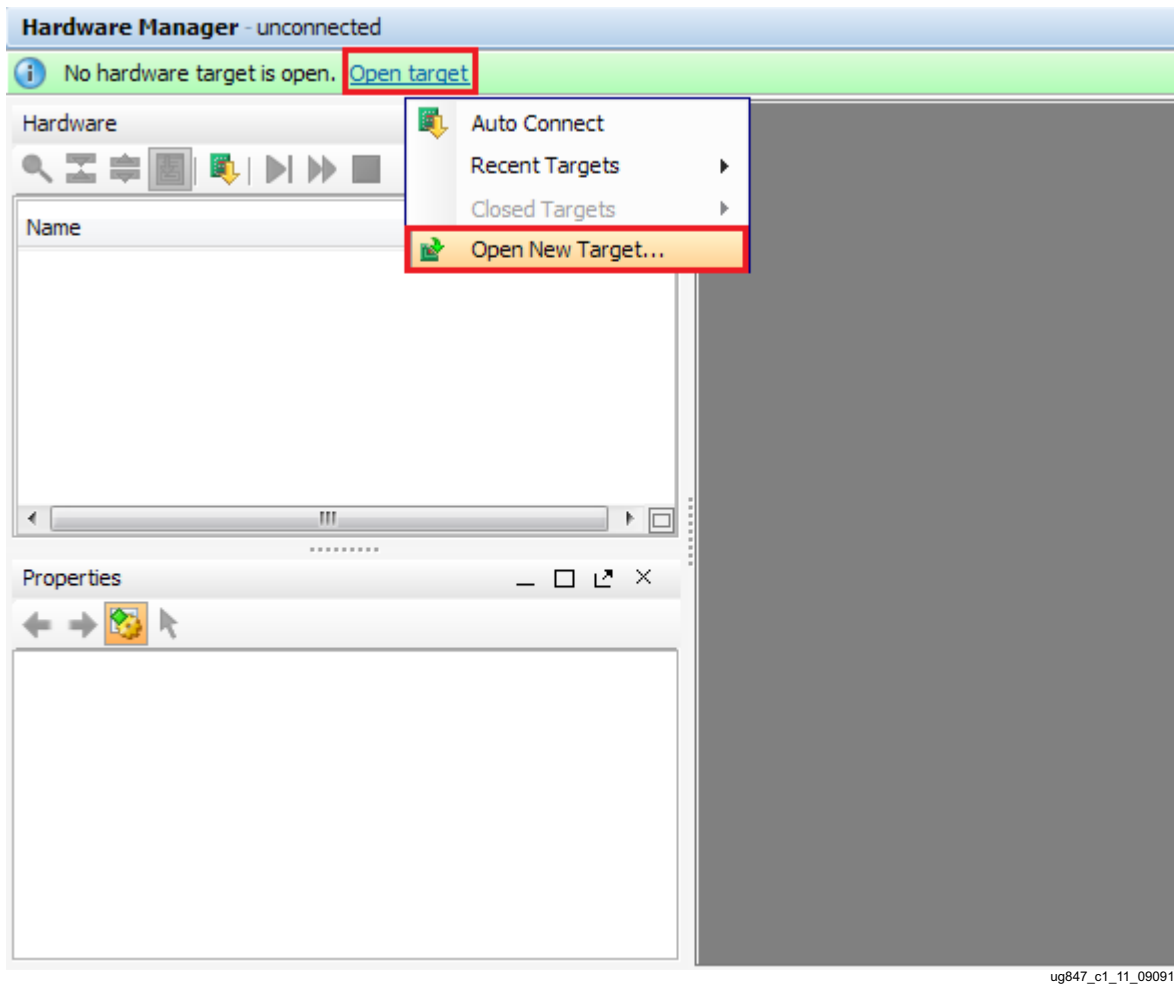

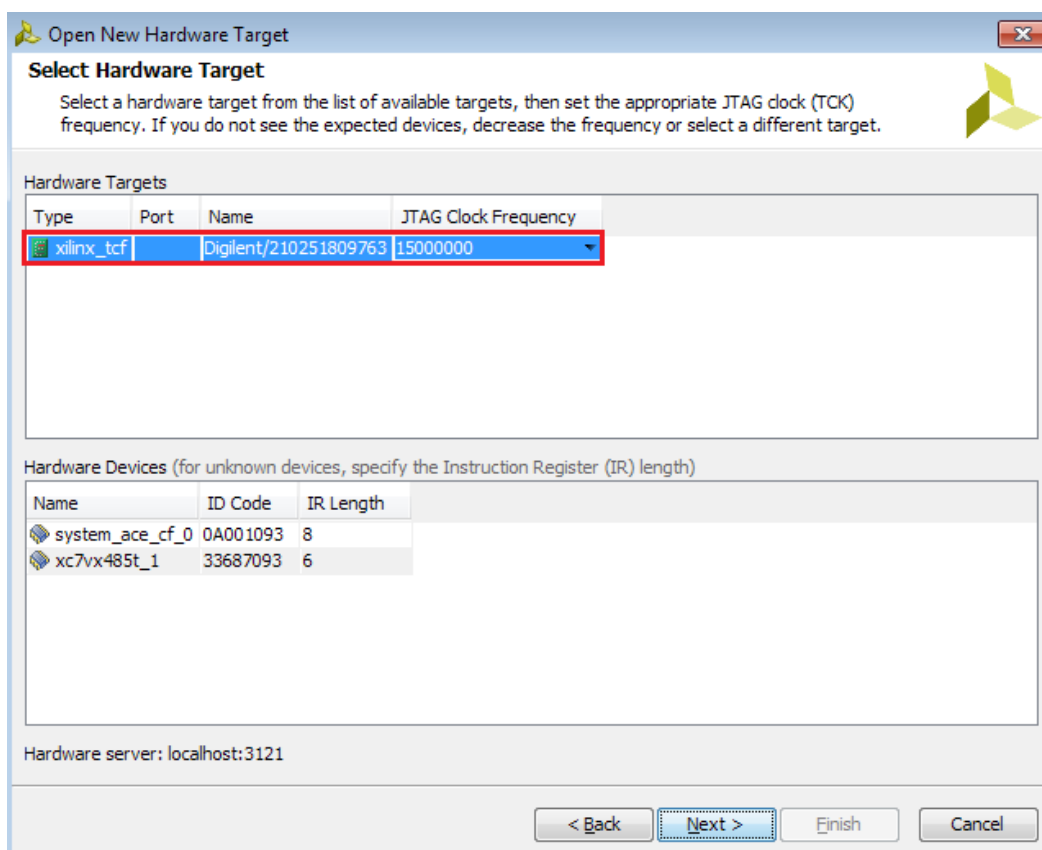

Figure 1-11: Open a New Hardware Target

3. An Open Hardware Target wizard pops up. Click **Next** on the first window.
4. In the Hardware Server Settings window, select **Local server (target is on local machine)**. Click **Next** to open the server and connect to the Xilinx TCF JTAG cable.

5. In the Select Hardware Target window, the **xilinx_tcf** cable appears under Hardware Targets, and the JTAG chain contents of the selected cable appear under Hardware Devices (Figure 1-12). Select the **xilinx_tcf** target and keep the JTAG Clock Frequency at the default value (15 MHz). Click **Next**.

UG847_c1_12_051314

Figure 1-12: Select Hardware Target

6. In the Open Hardware Target Summary window, click **Finish**. The wizard closes and the Vivado tool opens the hardware target.

Starting the SuperClock-2 Module

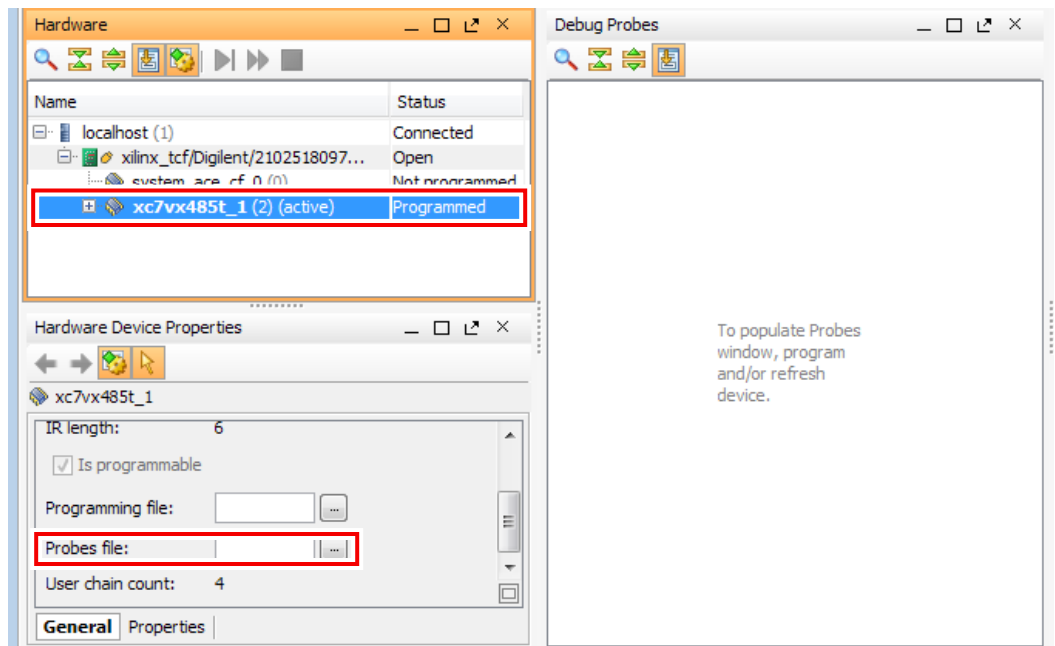

The IBERT demonstration designs use an integrated VIO core to control the clocks on the SuperClock-2 module. The SuperClock-2 module features two clock-source components: 1) An always-on Si570 crystal oscillator and, 2) an Si5368 jitter-attenuating clock multiplier. Outputs from either device can be used to drive the transceiver reference clocks.

To start the SuperClock-2 module:

1. The Vivado Design Suite Hardware window shows the System ACE tool and the XC7VX485T device. The XC7VX485T_1 device will be reported as programmed when an SD card is used to configure the FPGA during power reset (Figure 1-13). If the SD card is not available to program the XC7VX485T device, select the XC7VX485T_1 device, and in the Hardware Device Properties window, enter the file path to the configuration and the probes files associated with the Q115 IBERT design. The files are in the extracted IBERT files:

```
../vc7203_ibert_q115_152.bit
```

```
../vc7203_ibert_q115_debug_nets.ltx
```

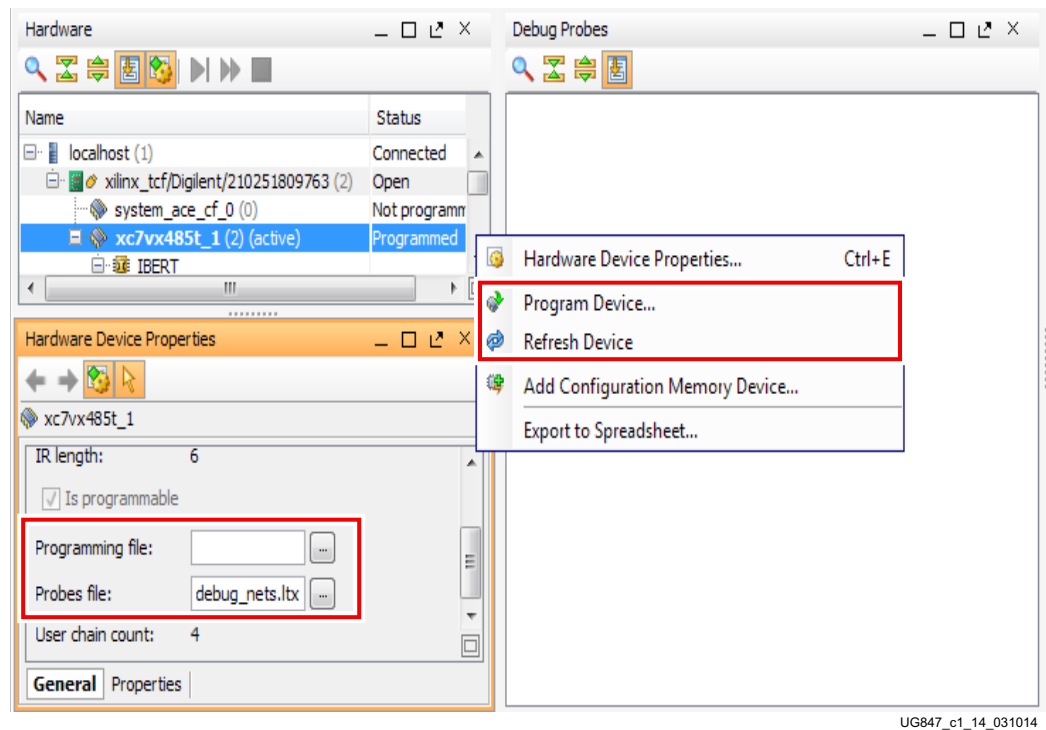

UG847_c1_13_030314

Figure 1-13: Adding the Probes File

2. In the Hardware window, right-click **XC7VX485T_1** and select **Refresh Device** (Figure 1-14).

Note: If the FPGA was not programmed using the SD card, provide both the programming and the probes files, and then select **Program Device**.

UG847_c1_14_031014

Figure 1-14: Program/Refresh Device

- The Vivado tool now shows the SuperClock-2 VIO core and the IBERT core. To configure the SuperClock-2 module, select **Tools > Run Tcl Script** (Figure 1-15). In the following Run Script window, navigate to the `setup_scm2_156_25.tcl` script in the extracted files and click **OK**.

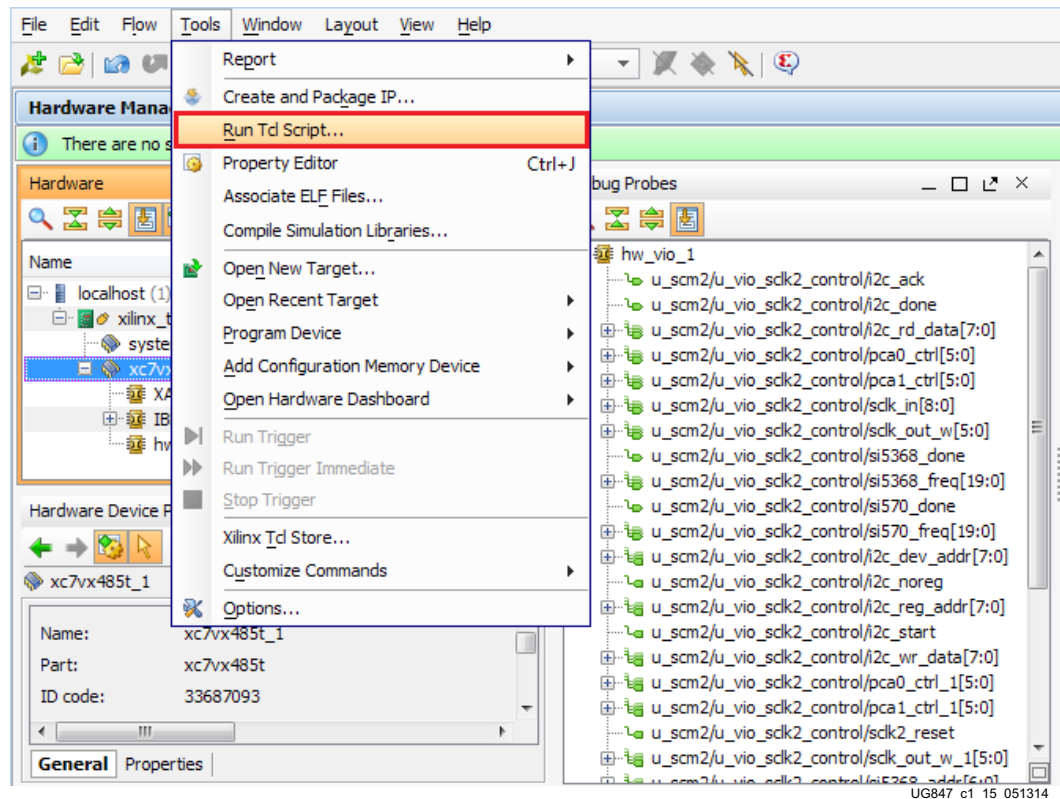

Figure 1-15: Run Tcl Script

- To view the SuperClock 2 settings in the VIO core, select the probe signal from the Debug Probes window and drag it to the VIO window. For example, the frequencies, ROM addresses, and start signals are selected from [Figure 1-16](#).

Note: The ROM address values for the Si5368 and Si570 devices (that is, si5368_addr[6:0] and si570_addr[6:0]) are preset to 60 to produce an output frequency of 156.250 MHz. Entering a different ROM address changes the reference clock(s) frequency. The complete list of pre-programmed SuperClock-2 frequencies and their associated ROM addresses is provided in [Table 1-2, page 26](#).

The screenshot shows the Xilinx IDE interface. On the left, the 'Debug Probes' window lists various signals. Several signals are highlighted with red boxes: `u_scm2/u_vio_sdk2_control/si5368_freq[19:0]`, `u_scm2/u_vio_sdk2_control/si570_freq[19:0]`, `u_scm2/u_vio_sdk2_control/si5368_addr[6:0]`, `u_scm2/u_vio_sdk2_control/si570_addr[6:0]`, `u_scm2/u_vio_sdk2_control/si5368_start`, `u_scm2/u_vio_sdk2_control/si570_start`, and `u_scm2/u_vio_sdk2_control/si570_recall`. On the right, the 'VIO - hw_vio_1' window shows a table of VIO probes. The table has columns for Name, Value, Activity, Direction, and VIO. The following table represents the data shown in the VIO window:

Name	Value	Activity	Direction	VIO
u_scm2/u_vio_sdk2_control/si5368_freq[19:0]	[U] 156250		Input	hw_vio_1
u_scm2/u_vio_sdk2_control/si570_freq[19:0]	[U] 156250		Input	hw_vio_1
u_scm2/u_vio_sdk2_control/si5368_addr[6:0]	[U] 60		Output	hw_vio_1
u_scm2/u_vio_sdk2_control/si570_addr[6:0]	[U] 60		Output	hw_vio_1
u_scm2/u_vio_sdk2_control/si5368_start	[B] 0		Output	hw_vio_1
u_scm2/u_vio_sdk2_control/si570_start	[B] 0		Output	hw_vio_1

Annotations with red arrows point from the highlighted signals in the Debug Probes window to the corresponding entries in the VIO window table:

- The Frequency for both clocks is set to 156.25 MHz
- The ROM address value for both clocks is set to 60 (156.25MHz)
- Si5368 and Si570 start buttons (clock starts on rising edge)

UG847_c1_16_031714

Figure 1-16: SuperClock-2 Module VIO Core

- To view the GTX transceiver operation, click **Layout > Serial I/O Analyzer**. From the top of the Hardware Manager window, select **Auto-detect Links** to display all available links automatically. Links can also be created manually in the Links window by right-clicking and selecting **Create Links**, or by clicking the **Create Links** button (Figure 1-17).

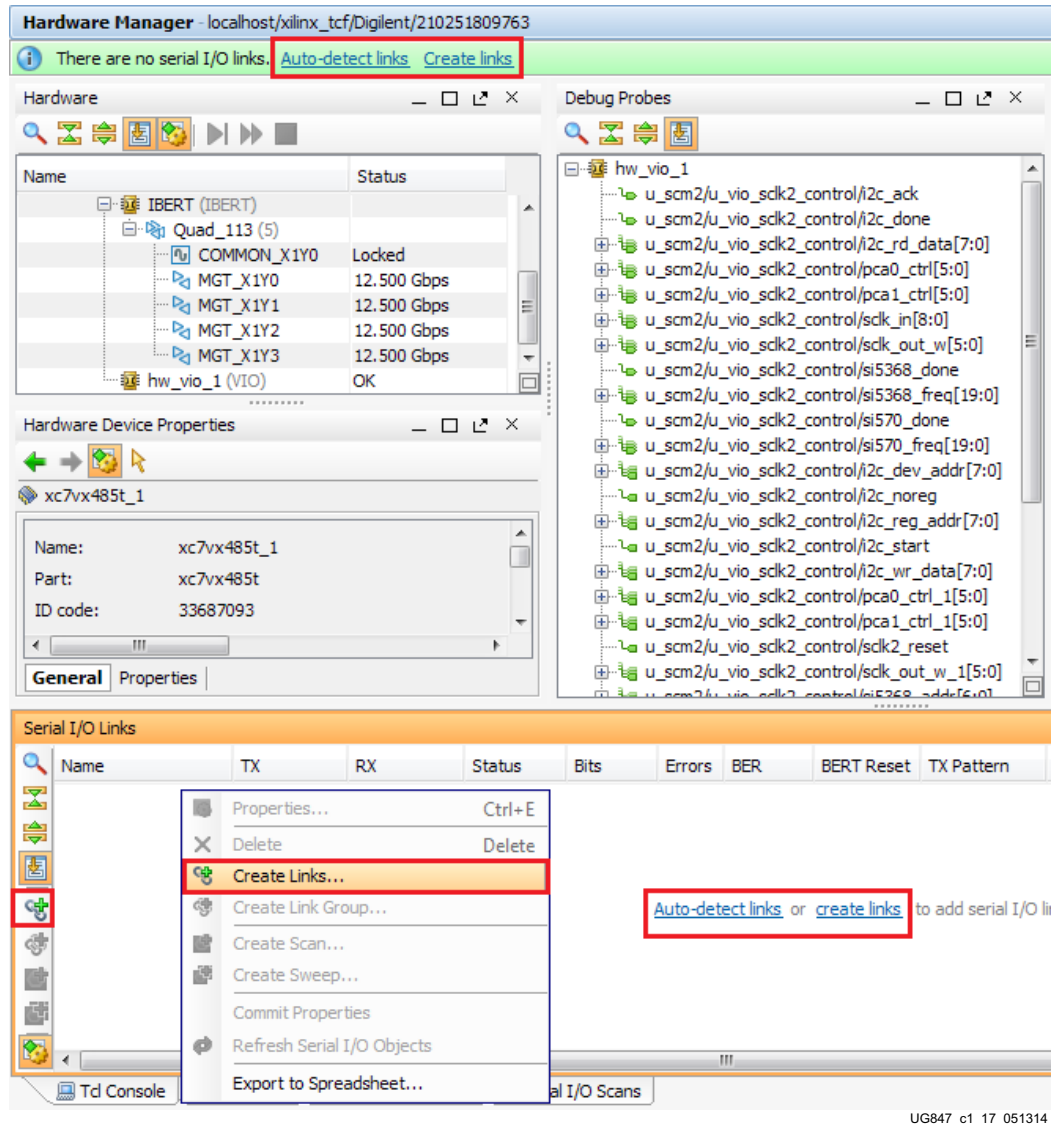

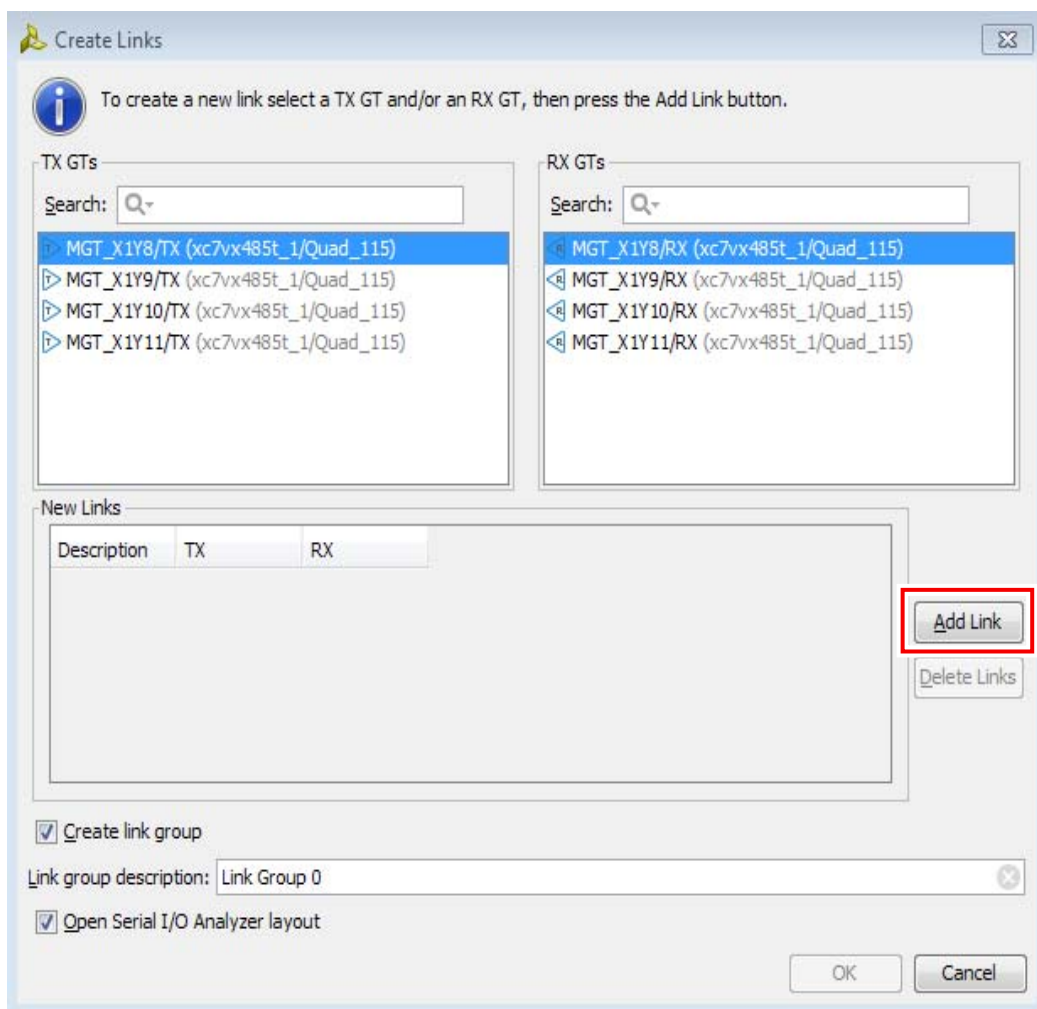

Figure 1-17: Serial I/O Analyzer - Create Links

6. If links are created manually, the Create Links window is displayed. The options in this window are used to link any TX GT to any RX GT. To create links, select the TX GT and RX GT from the two lists, then click the **Add Link** button. For this project, connect the following links (Figure 1-18).
- MGT_X1Y8/TX to MGT_X1Y8/RX
 - MGT_X1Y9/TX to MGT_X1Y9/RX
 - MGT_X1Y10/TX to MGT_X1Y10/RX
 - MGT_X1Y11/TX to MGT_X1Y11/RX

UG847_c1_18_031014

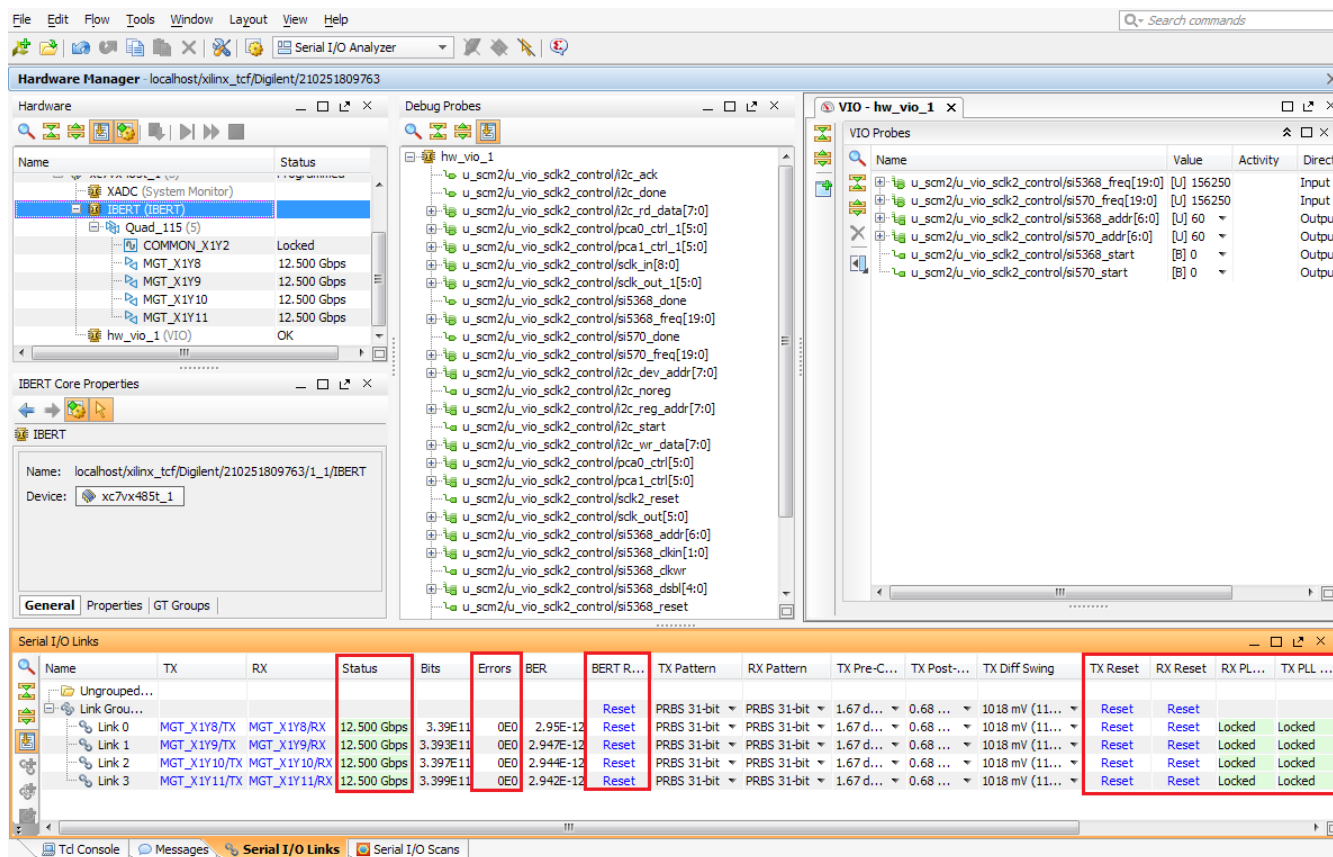

Figure 1-18: Create Links Window

Viewing GTX Transceiver Operation

After completing [step 6](#) in [Starting the SuperClock-2 Module](#), the IBERT demonstration is configured and running. The status and test settings are displayed on the Links tab in the Links window shown in [Figure 1-19](#).

Note the line rate and error count:

- The line rate for all four GTX transceivers is 12.5 Gb/s (see **Status** in [Figure 1-19](#)).
- Verify that there are no bit errors.

UG847_c1_19_090914

Figure 1-19: Serial I/O Analyzer Links

In Case of RX Bit Errors

If there are initial bit errors after linking, or as a result of changing the TX or RX pattern, click the respective BERT **Reset** button to zero the count.

If the **MGT Link Status** shows **No Link** for one or more transceivers:

- Make sure the blue elastomer seal is connected to the bottom of the BullsEye cable and the cable is firmly connected and flush on the board.
- Increase the TX differential swing of the transceiver (to compensate for any loss due to PCB process variation)
- Click the respective **TX Reset** button followed by **BERT Reset** ([Figure 1-19](#)).

Additional information on the Vivado Design Suite software and IBERT core can be found in *Vivado Design Suite User Guide: Programming and Debugging* (UG908) [Ref 3] and *LogiCORE IP Integrated Bit Error Ratio Tester (IBERT) for 7 Series GTX Transceivers Product Guide for Vivado Design Suite* (PG132) [Ref 4].

Closing the IBERT Demonstration

To stop the IBERT demonstration:

1. Close the Vivado Design Suite application by selecting **File > Exit**.
2. Place the main power switch SW1 in the off position.

SuperClock-2 Frequency Table

Table 1-2 lists the addresses for the frequencies that are programmed into the SuperClock-2 read-only-memory (ROM).

Table 1-2: Si570 and Si5368 Frequency Table

Address	Protocol	Frequency (MHz)	Address	Protocol	Frequency (MHz)	Address	Protocol	Frequency (MHz)
0	100GE/40GE/10GE	161.130	30	OBSAI	307.200	60	XAUI	156.250
1	Aurora	81.250	31	OBSAI	614.400	61	XAUI	312.500

Creating the GTX IBERT Core

Vivado Design Suite 2014.3 is required to rebuild the designs shown here.

This section provides a procedure to create a single Quad GTX IBERT core with integrated SuperClock-2 controller. The procedure assumes Quad 113 and 12.5 Gb/s line rate, but cores for any of the GTX Quads with any supported line rate can be created following the same series of steps.

For more details on generating IBERT cores, refer to *Vivado Design Suite User Guide: Programming and Debugging* (UG908) [Ref 3].

1. Start the Vivado Design Suite.
2. In the Vivado design tools window, click the **Manage IP** icon (highlighted in Figure 1-20), then select **New IP Location**.

UG847_c1_20_051314

Figure 1-20: Vivado Design Suite Initial Window

3. When the Create a New Customized IP Location dialog window opens (not shown), click **Next**.

- In the Manage IP Settings window, select a part by clicking the (...) button next to the Part field. A Select Device window pops up. Use the drop-down menu items to narrow the choices. Select the **xc7vx485tffg1761-3** device (Figure 1-21). Click **OK**.

Filter, search, and browse parts by their resources. The selected part or board will be applied.

Select: **Parts** **Boards**

UG847_c1_21_090914

Figure 1-21: Select Device

5. Back on the Manage IP Settings window, select **Verilog** for Target language, **Vivado Simulator** for Target simulator, **Mixed** for Simulator language, and a directory to save the customized IP (Figure 1-22). Click **Finish**.

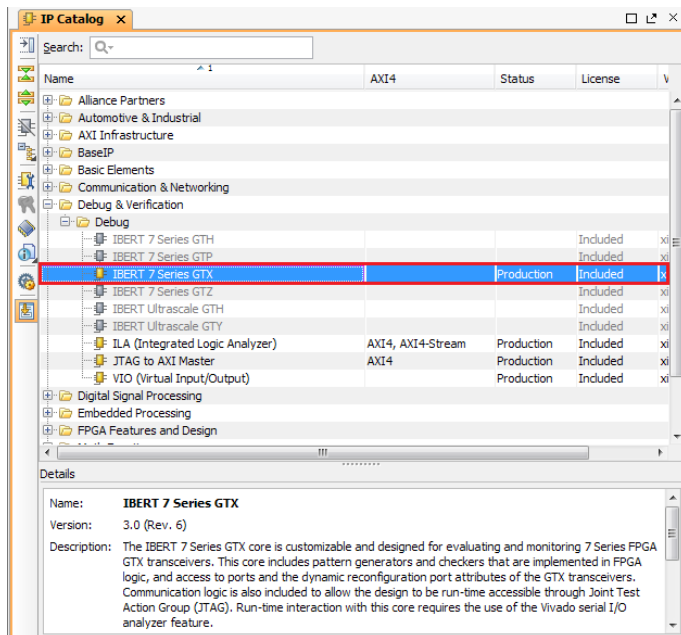

The image shows the 'Manage IP Settings' dialog box in Vivado. The title bar says 'Manage IP Settings' and the subtitle is 'Set options for creating and generating IP.' The dialog contains five fields: 'Part' with a dropdown showing 'xc7vx485tffg1761-3 (active)', 'Target language' with a dropdown showing 'Verilog', 'Target simulator' with a dropdown showing 'Vivado Simulator', 'Simulator language' with a dropdown showing 'Mixed', and 'IP location' with a text field showing 'C:/VC7203'. At the bottom right, there are four buttons: '< Back', 'Next >', 'Finish' (highlighted in blue), and 'Cancel'.

UG847_c1_22_090914

Figure 1-22: Manage IP Settings

6. In the Vivado IP Catalog window, open the **Debug & Verification** folder, then open the **Debug** folder, and double-click **IBERT 7 Series GTX** (Figure 1-23).

UG847_c1_23_090914

Figure 1-23: IP Catalog

7. A Customize IP window opens. In the Protocol Definition tab, change **LineRate (Gbps)** to **12.5**, then use the drop-down to change the **Refclk (MHz)** to **156.250**. Keep defaults for other fields (Figure 1-24).

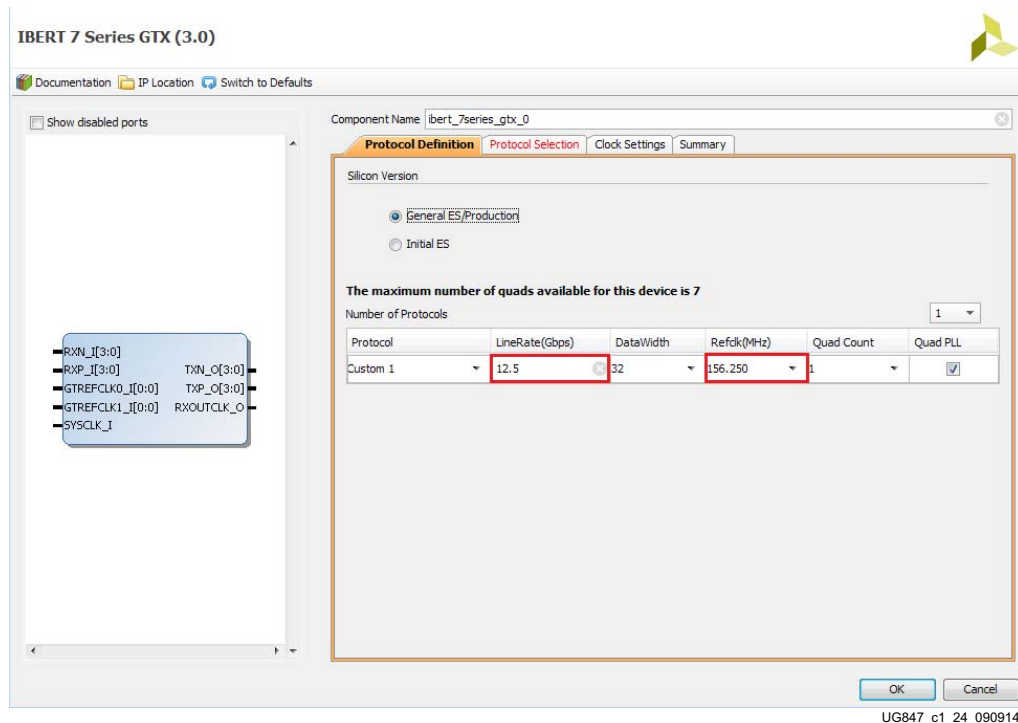

Figure 1-24: Customize IP - Protocol Definition

8. In the Protocol Selection tab, select **Custom 1 / 12.5 Gbps** in the drop-down menu under Protocol Selected next to **QUAD_113**, and select **MGTREFCLK1 113** in the Refclk Selection drop-down menu (Figure 1-25).

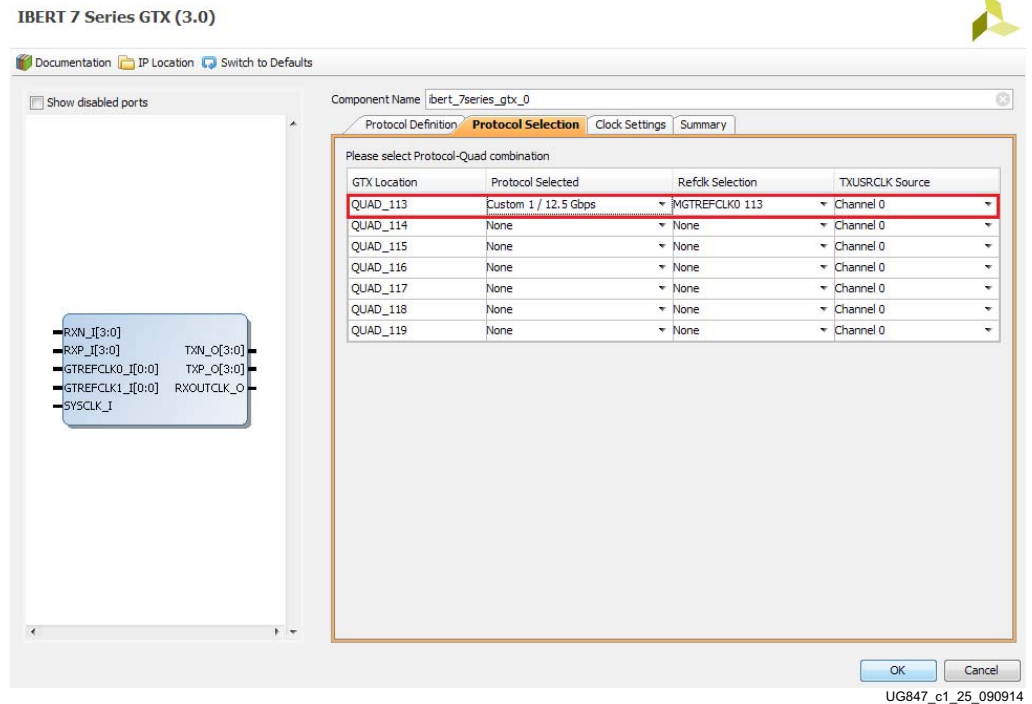

Figure 1-25: Customize IP - Protocol Selection

9. In the Clock Settings tab, select **DIFF SSTL15** for the I/O Standard, enter **E19** for P Package Pin and **E18** for N Package Pin (the FPGA pins that the system clock connects to), and make sure the Frequency is set to **200.00** (Figure 1-26). Press **OK**. A Generate Output Products window opens. Leave the defaults unchanged, and press **Generate**.

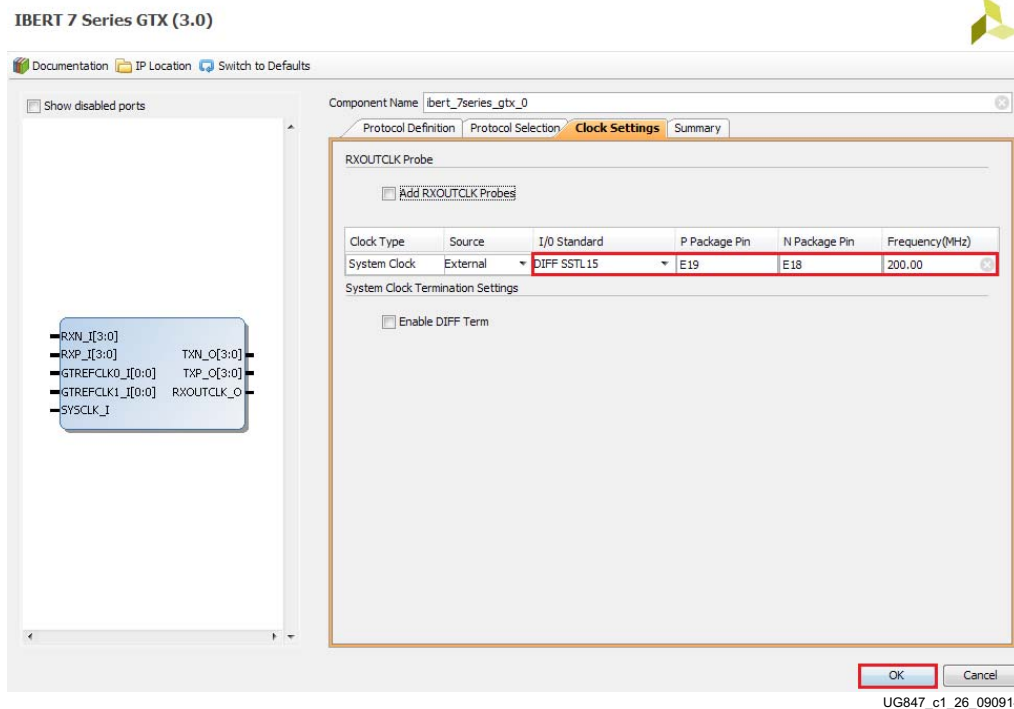

Figure 1-26: Customize IP - Clock Settings

10. Back to Manage IP, in the Sources window, right-click the **IBERT IP** and select **Open IP Example Design** (Figure 1-27). Specify a location to save the design, press **OK**, and the design opens in a new Vivado design tools window.

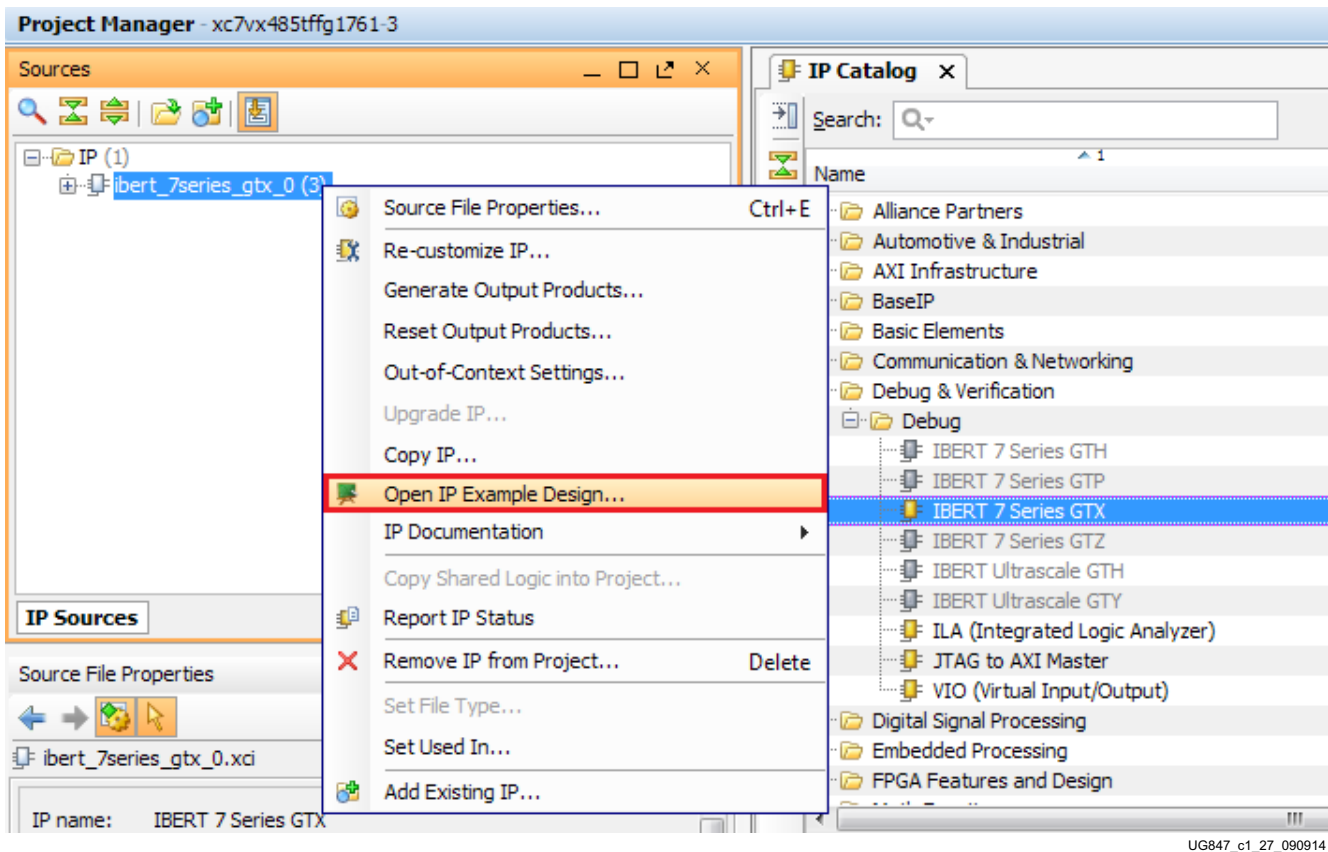

Figure 1-27: Open IP Example Design

11. In the new window, select **Tools > Run Tcl Script**. In the Run Script window, navigate to `add_scm2.tcl` in the extracted files and press **OK**. The SuperClock-2 Module Design Sources and Constraints are automatically added to the example design (Figure 1-28).

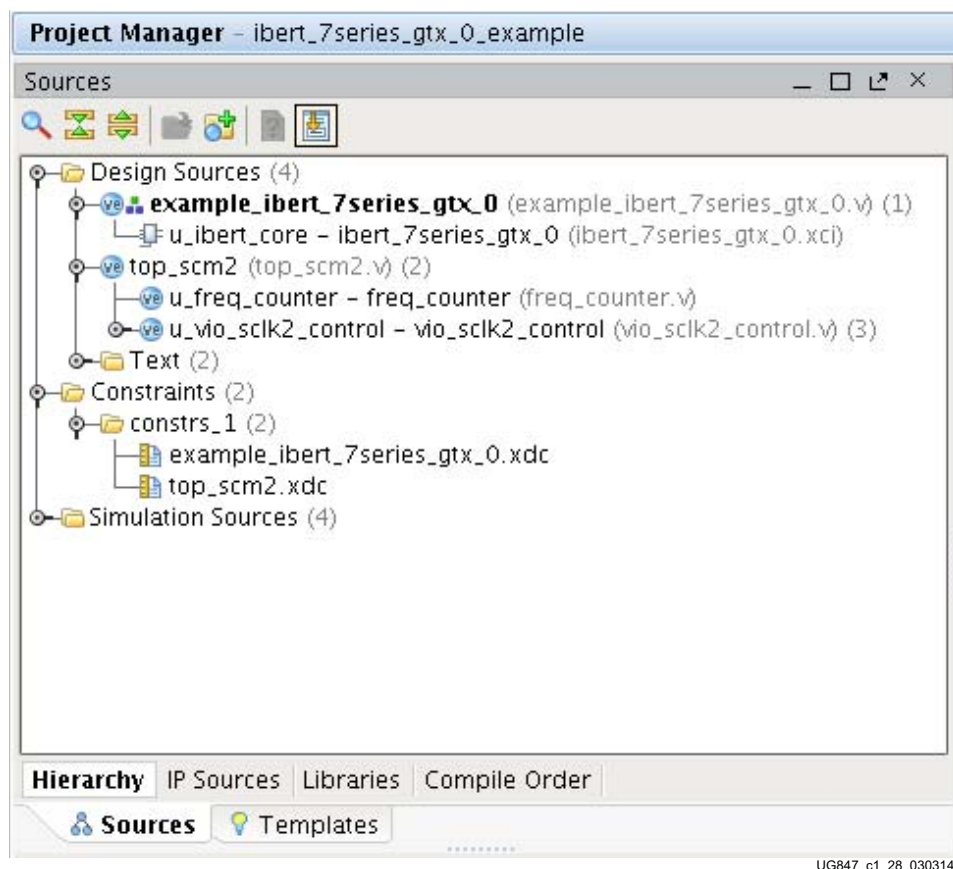

Figure 1-28: Sources after Running `add_scm2.tcl`

12. The SuperClock-2 source code now needs to be added to the example IBERT wrapper. Double-click **example_ibert_7series_gtx_0** in Design Sources to open the Verilog code. Add the top level ports from **top_scm2.v** to the module declaration and instantiate the **top_scm2** module in the example IBERT wrapper (Figure 1-29). Click **File > Save File**.

```

21 module example_ibert_7series_gtx_0

```

UG847_c1_29_090914

Figure 1-29: SuperClock-2 in the Example IBERT Wrapper

13. In the Sources window, Design Sources should now reflect that the SuperClock-2 module is part of the example IBERT design (Figure 1-30).

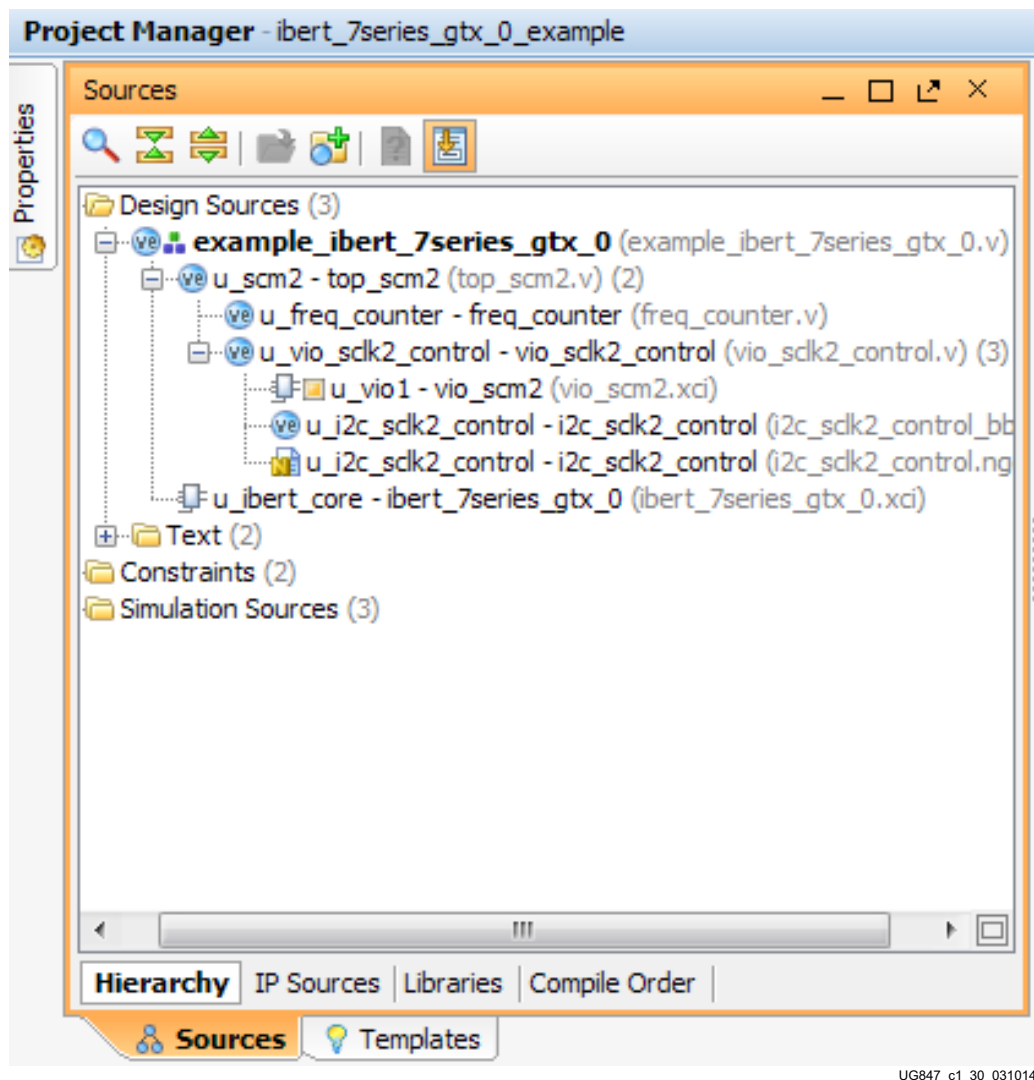

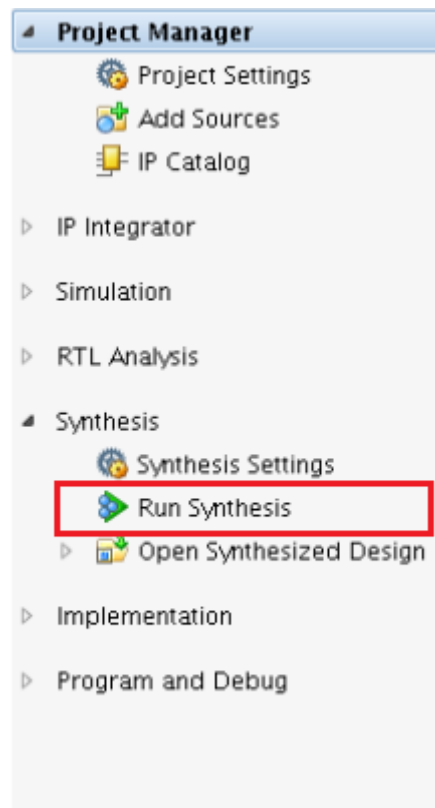

Figure 1-30: Design Sources File Hierarchy

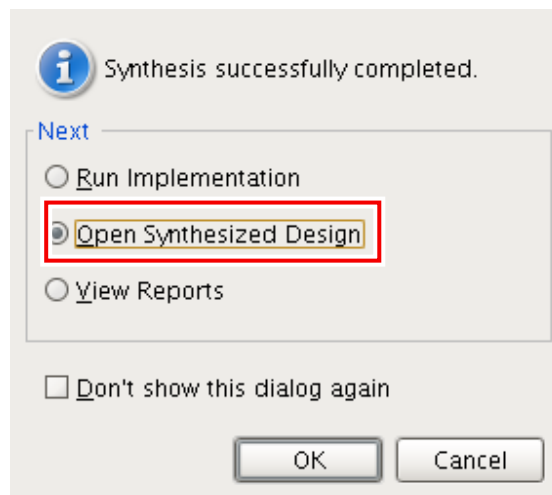

14. Click **Run Synthesis** in the Flow Navigator to synthesize the design (Figure 1-31).

UG847_c1_31_032714

Figure 1-31: Project Manager Window

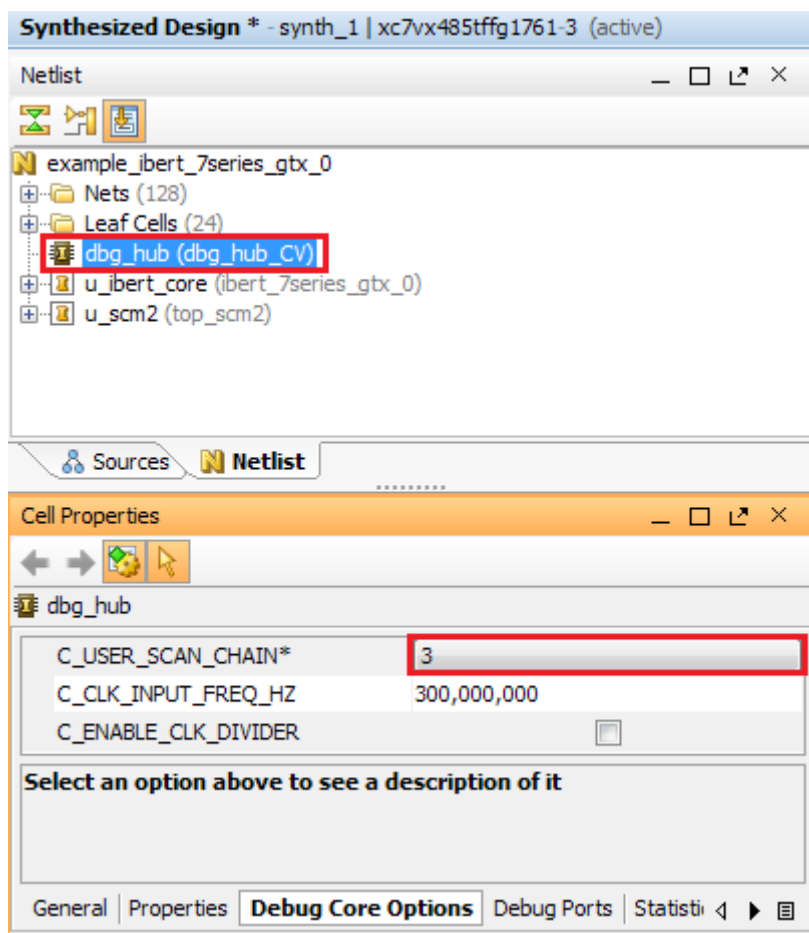

15. When synthesis is done, a Synthesis Complete window opens. Select **Open Synthesized Design** and click **OK** (Figure 1-32).

UG847_c1_32_032714

Figure 1-32: Synthesis Completed

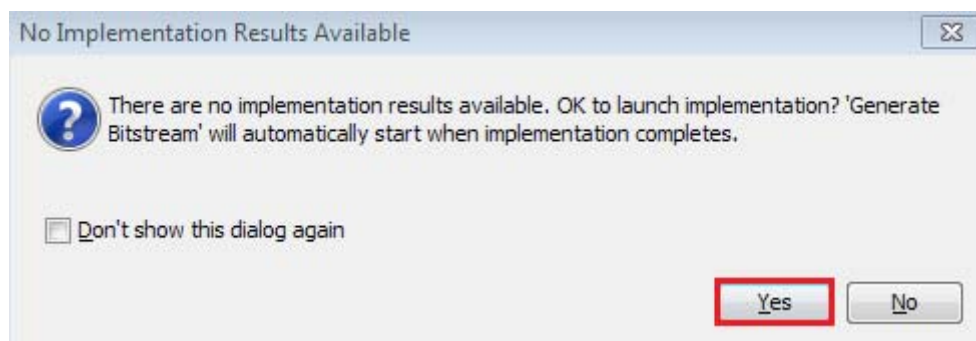

16. When the Synthesized Design opens, select **dbg_hub** in the Netlist window, then select the **Debug Core Options** tab in the Cell Properties window and change C_USER_SCAN_CHAIN* to **3** (Figure 1-33). Click **File > Save Constraints**.

UG847_c1_33_090914

Figure 1-33: Dbg_hub Debug Core Options

17. In the Flow Navigator under Program and Debug, click **Generate Bitstream** (Figure 1-34). A window pops up asking if it is okay to launch implementation. Click **Yes**.

UG847_c1_34_090914

Figure 1-34: Generate Bitstream

18. When the Bitstream Generation Completed dialog window appears, click **Cancel** (Figure 1-35).

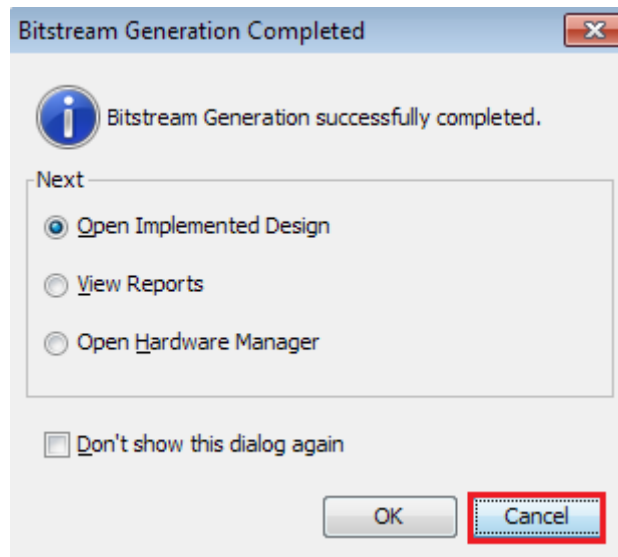

Figure 1-35: Bitstream Generation Completed

19. When the bitstream generation completes, navigate to the project directory and locate the generated bitstream file. When implementation completes, navigate to:
\\ibert_7series_gtx_0\\ibert_7series_gtx_0_example\\ibert_7series_gtx_0_example.runs\\impl_1 directory to locate the generated bitstream.

Warranty

THIS LIMITED WARRANTY applies solely to standard hardware development boards and standard hardware programming cables manufactured by or on behalf of Xilinx (“Development Systems”). Subject to the limitations herein, Xilinx warrants that Development Systems, when delivered by Xilinx or its authorized distributor, for ninety (90) days following the delivery date, will be free from defects in material and workmanship and will substantially conform to Xilinx publicly available specifications for such products in effect at the time of delivery. This limited warranty excludes: (i) engineering samples or beta versions of Development Systems (which are provided “AS IS” without warranty); (ii) design defects or errors known as “errata”; (iii) Development Systems procured through unauthorized third parties; and (iv) Development Systems that have been subject to misuse, mishandling, accident, alteration, neglect, unauthorized repair or installation. Furthermore, this limited warranty shall not apply to the use of covered products in an application or environment that is not within Xilinx specifications or in the event of any act, error, neglect or default of Customer. For any breach by Xilinx of this limited warranty, the exclusive remedy of Customer and the sole liability of Xilinx shall be, at the option of Xilinx, to replace or repair the affected products, or to refund to Customer the price of the affected products. The availability of replacement products is subject to product discontinuation policies at Xilinx. Customer may not return product without first obtaining a customer return material authorization (RMA) number from Xilinx.

THE WARRANTIES SET FORTH HEREIN ARE EXCLUSIVE. XILINX DISCLAIMS ALL OTHER WARRANTIES, WHETHER EXPRESS, IMPLIED OR STATUTORY, INCLUDING, WITHOUT LIMITATION, ANY WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT, AND ANY WARRANTY THAT MAY ARISE FROM COURSE OF DEALING, COURSE OF PERFORMANCE, OR USAGE OF TRADE. (2008.10)

Do not throw Xilinx products marked with the “crossed out wheeled bin” in the trash. Directive 2002/96/EC on waste electrical and electronic equipment (WEEE) requires the separate collection of WEEE. Your cooperation is essential in ensuring the proper management of WEEE and the protection of the environment and human health from potential effects arising from the presence of hazardous substances in WEEE. Return the marked products to Xilinx for proper disposal. Further information and instructions for free-of-charge return available at: www.xilinx.com/ehs/weee.htm.
