

## Summary

The Xilinx® Kintex® UltraScale+™ FPGAs are available in -3, -2, -1 speed grades, with -3E devices having the highest performance. The -2LE and -1LI devices can operate at a  $V_{CCINT}$  voltage at 0.85V or 0.72V and provide lower maximum static power. When operated at  $V_{CCINT} = 0.85V$ , using -2LE and -1LI devices, the speed specification for the L devices is the same as the -2I or -1I speed grades. When operated at  $V_{CCINT} = 0.72V$ , the -2LE and -1LI performance and static and dynamic power is reduced.

DC and AC characteristics are specified in extended (E) and industrial (I) temperature ranges. Except the operating temperature range or unless otherwise noted, all the DC and AC electrical parameters are the same for a particular speed grade (that is, the timing characteristics of a -1 speed grade extended device are the same as for a -1 speed grade industrial device). However, only selected speed grades and/or devices are available in each temperature range.

All supply voltage and junction temperature specifications are representative of worst-case conditions. The parameters included are common to popular designs and typical applications.

This data sheet, part of an overall set of documentation on the Kintex UltraScale+ FPGAs, is available on the Xilinx website at [www.xilinx.com/documentation](http://www.xilinx.com/documentation).

**Notes:**

- All voltages are relative to GND.
- For the design of the power distribution system consult *UltraScale Architecture PCB Design Guide* ([UG583](#)).
- $V_{CCINT\_IO}$  must be connected to  $V_{CCBRAM}$ .
- For  $V_{CCO\_0}$ , the minimum recommended operating voltage for power on and during configuration is 1.425V. After configuration, data is retained even if  $V_{CCO}$  drops to 0V.
- Includes  $V_{CCO}$  of 1.0V (HP I/O only), 1.2V, 1.35V, 1.5V, 1.8V, 2.5V (HD I/O only) at  $\pm 5\%$ , and 3.3V (HD I/O only) at  $+3/-5\%$ .
- $V_{CCAUX\_IO}$  must be connected to  $V_{CCAUX}$ .
- The lower absolute voltage specification always applies.
- A total of 200 mA per bank should not be exceeded.
- If battery is not used, connect  $V_{BATT}$  to either GND or  $V_{CCAUX}$ .
- Each voltage listed requires filtering as described in *UltraScale Architecture GTH Transceiver User Guide* ([UG576](#)) or *UltraScale Architecture GTY Transceiver User Guide* ([UG578](#)).
- Devices labeled with the speed/temperature grade of -2LE can operate for a limited time at a junction temperature between 100°C and 110°C. Timing parameters adhere to the same speed file at 110°C as they do below 110°C, regardless of operating voltage (nominal voltage of 0.85V or a low-voltage of 0.72V). Operation up to  $T_j = 110^\circ\text{C}$  is limited to 1% of the device lifetime and can occur sequentially or at regular intervals as long as the total time does not exceed 1% of the device lifetime.
- Xilinx recommends measuring the  $T_j$  of a device using the system monitor as described in the *UltraScale Architecture System Monitor User Guide* ([UG580](#)). The SYSMON temperature measurement errors (that are described in [Table 76](#)) must be accounted for in your design. For example, by using an external reference of 1.25V, when SYSMON reports 97°C, there is a measurement error  $\pm 3^\circ\text{C}$ . A reading of 97°C is considered the maximum adjusted  $T_j$  ( $100^\circ\text{C} - 3^\circ\text{C} = 97^\circ\text{C}$ ).
- Do not program eFUSE during device configuration (e.g., during configuration, during configuration readback, or when readback CRC is active).

## Power-On/Off Power Supply Sequencing

The recommended power-on sequence is  $V_{CCINT}$ ,  $V_{CCINT\_IO}/V_{CCBRAM}$ ,  $V_{CCAUX}/V_{CCAUX\_IO}$ , and  $V_{CCO}$  to achieve minimum current draw and ensure that the I/Os are 3-stated at power-on. The recommended power-off sequence is the reverse of the power-on sequence. If  $V_{CCINT}$  and  $V_{CCINT\_IO}/V_{CCBRAM}$  have the same recommended voltage levels, they can be powered by the same supply and ramped simultaneously.  $V_{CCINT\_IO}$  must be connected to  $V_{CCBRAM}$ . If  $V_{CCAUX}/V_{CCAUX\_IO}$  and  $V_{CCO}$  have the same recommended voltage levels, they can be powered by the same supply and ramped simultaneously.  $V_{CCAUX}$  and  $V_{CCAUX\_IO}$  must be connected together.  $V_{CCADC}$  and  $V_{REF}$  can be powered at any time and have no power-up sequencing requirements.

The recommended power-on sequence to achieve minimum current draw for the GTH or GTY transceivers is  $V_{CCINT}$ ,  $V_{MGTAVCC}$ ,  $V_{MGTAVTT}$  OR  $V_{MGTAVCC}$ ,  $V_{CCINT}$ ,  $V_{MGTAVTT}$ . There is no recommended sequencing for  $V_{MGTVCCAUX}$ . Both  $V_{MGTAVCC}$  and  $V_{CCINT}$  can be ramped simultaneously. The recommended power-off sequence is the reverse of the power-on sequence to achieve minimum current draw.

If these recommended sequences are not met, current drawn from  $V_{MGTAVTT}$  can be higher than specifications during power-up and power-down.

## Power Supply Requirements

Table 7 shows the minimum current, in addition to  $I_{CCQ}$  maximum, required by each Kintex UltraScale+ FPGA for proper power-on and configuration. If the current minimums shown in Table 7 are met, the device powers on after all supplies have passed through their power-on reset threshold voltages. The device must not be configured until after  $V_{CCINT}$  is applied. Once initialized and configured, use the Xilinx Power Estimator (XPE) tools to estimate current drain on these supplies.

## DC Input and Output Levels

Values for  $V_{IL}$  and  $V_{IH}$  are recommended input voltages. Values for  $I_{OL}$  and  $I_{OH}$  are guaranteed over the recommended operating conditions at the  $V_{OL}$  and  $V_{OH}$  test points. Only selected standards are tested. These are chosen to ensure that all standards meet their specifications. The selected standards are tested at a minimum  $V_{CCO}$  with the respective  $V_{OL}$  and  $V_{OH}$  voltage levels shown. Other standards are sample tested.

Symbol	DC Parameter	Conditions	Min	Typ	Max	Units
$V_{CCO}^{(1)}$	Supply voltage.		2.375	2.500	2.625	V
$V_{IDIFF}$	Differential input voltage: ( $\overline{Q} - Q$ ), $\overline{Q} = \text{High}$ ( $Q - \overline{Q}$ ), $Q = \text{High}$		100	350	600 <sup>(2)</sup>	mV
$V_{ICM}$	Input common-mode voltage.		0.300	1.200	1.425	V

### Notes:

- LVDS\_25 in HD I/O banks supports inputs only. LVDS\_25 inputs without internal termination have no  $V_{CCO}$  requirements. Any  $V_{CCO}$  can be chosen as long as the input voltage levels do not violate the *Recommended Operating Condition* (Table 2) specification for the  $V_{IN}$  I/O pin voltage.
- Maximum  $V_{IDIFF}$  value is specified for the maximum  $V_{ICM}$  specification. With a lower  $V_{ICM}$ , a higher  $V_{IDIFF}$  is tolerated only when the recommended operating conditions and overshoot/undershoot  $V_{IN}$  specifications are maintained.

## LVDS DC Specifications (LVDS)

The LVDS standard is available in the HP I/O banks. See the *UltraScale Architecture SelectIO Resources User Guide* ([UG571](#)) for more information.

Table 19: LVDS DC Specifications

Symbol	DC Parameter	Conditions	Min	Typ	Max	Units
$V_{CCO}^{(1)}$	Supply voltage.		1.710	1.800	1.890	V
$V_{ODIFF}^{(2)}$	Differential output voltage: ( $\overline{Q} - Q$ ), $\overline{Q} = \text{High}$ ( $Q - \overline{Q}$ ), $Q = \text{High}$	$R_T = 100\Omega$ across $Q$ and $\overline{Q}$ signals	247	350	454	mV
$V_{OCM}^{(2)}$	Output common-mode voltage.	$R_T = 100\Omega$ across $Q$ and $\overline{Q}$ signals	1.000	1.250	1.425	V
$V_{IDIFF}^{(3)}$	Differential input voltage: ( $\overline{Q} - Q$ ), $\overline{Q} = \text{High}$ ( $Q - \overline{Q}$ ), $Q = \text{High}$		100	350	600 <sup>(3)</sup>	mV
$V_{ICM\_DC}^{(4)}$	Input common-mode voltage (DC coupling).		0.300	1.200	1.425	V
$V_{ICM\_AC}^{(5)}$	Input common-mode voltage (AC coupling).		0.600	–	1.100	V

### Notes:

- In HP I/O banks, when LVDS is used with input-only functionality, it can be placed in a bank where the  $V_{CCO}$  levels are different from the specified level only if internal differential termination is not used. In this scenario,  $V_{CCO}$  must be chosen to ensure the input pin voltage levels do not violate the *Recommended Operating Condition* (Table 2) specification for the  $V_{IN}$  I/O pin voltage.
- $V_{OCM}$  and  $V_{ODIFF}$  values are for  $LVDS\_PRE\_EMPHASIS = \text{FALSE}$ .
- Maximum  $V_{IDIFF}$  value is specified for the maximum  $V_{ICM}$  specification. With a lower  $V_{ICM}$ , a higher  $V_{IDIFF}$  is tolerated only when the recommended operating conditions and overshoot/undershoot  $V_{IN}$  specifications are maintained.
- Input common mode voltage for DC coupled configurations.  $EQUALIZATION = \text{EQ\_NONE}$  (Default).
- External input common mode voltage specification for AC coupled configurations.  $EQUALIZATION = \text{EQ\_LEVEL0}$ ,  $\text{EQ\_LEVEL1}$ ,  $\text{EQ\_LEVEL2}$ ,  $\text{EQ\_LEVEL3}$ ,  $\text{EQ\_LEVEL4}$ .

## AC Switching Characteristics

All values represented in this data sheet are based on the speed specifications in the Vivado® Design Suite as outlined in [Table 20](#).

*Table 20: Speed Specification Version By Device*

2017.2	Device
1.09	XCKU11P
1.12	XCKU3P, XCKU5P, XCKU9P, XCKU13P, and XCKU15P

Switching characteristics are specified on a per-speed-grade basis and can be designated as Advance, Preliminary, or Production. Each designation is defined as follows:

### Advance Product Specification

These specifications are based on simulations only and are typically available soon after device design specifications are frozen. Although speed grades with this designation are considered relatively stable and conservative, some under-reporting might still occur.

### Preliminary Product Specification

These specifications are based on complete ES (engineering sample) silicon characterization. Devices and speed grades with this designation are intended to give a better indication of the expected performance of production silicon. The probability of under-reporting delays is greatly reduced as compared to Advance data.

### Product Specification

These specifications are released once enough production silicon of a particular device family member has been characterized to provide full correlation between specifications and devices over numerous production lots. There is no under-reporting of delays, and customers receive formal notification of any subsequent changes. Typically, the slowest speed grades transition to production before faster speed grades.

## Testing of AC Switching Characteristics

Internal timing parameters are derived from measuring internal test patterns. All AC switching characteristics are representative of worst-case supply voltage and junction temperature conditions.

For more specific, more precise, and worst-case guaranteed data, use the values reported by the static timing analyzer and back-annotate to the simulation net list. Unless otherwise noted, values apply to all Kintex UltraScale+ FPGAs.

## Speed Grade Designations

Since individual family members are produced at different times, the migration from one category to another depends completely on the status of the fabrication process for each device. [Table 21](#) correlates the current status of the Kintex UltraScale+ FPGAs on a per speed grade basis.

### Notes:

- The lowest power -1L and -2L devices, where  $V_{CCINT} = 0.72V$ , are listed in the Vivado Design Suite as -1LV and -2LV respectively.

## Production Silicon and Software Status

In some cases, a particular family member (and speed grade) is released to production before a speed specification is released with the correct label (Advance, Preliminary, Production). Any labeling discrepancies are corrected in subsequent speed specification releases.

Table 22 lists the production released Kintex UltraScale+ FPGAs, speed grade, and the minimum corresponding supported speed specification version and Vivado software revisions. The Vivado software and speed specifications listed are the minimum releases required for production. All subsequent releases of software and speed specifications are valid.

**Notes:**

1. Native mode is supported through the [High-Speed SelectIO Interface Wizard](#) available with the Vivado Design Suite. The performance values assume a source-synchronous interface.
2. PLL settings can restrict the minimum allowable data rate. For example, when using the PLL with CLKOUTPHY\_MODE = VCO\_HALF the minimum frequency is PLL\_FVCOMIN/2.
3. LVDS receivers are typically bounded with certain applications to achieve maximum performance. Package skews are not included and should be removed through PCB routing.

Refer to [Memory Interfaces](#) for the complete list of memory interface standards supported and detailed specifications. The final performance of the memory interface is determined through a complete design implemented in the Vivado Design Suite, following guidelines in the *UltraScale Architecture PCB Design Guide* ([UG583](#)), electrical analysis, and characterization of the system.

# FPGA Logic Switching Characteristics

Table 28 (high-density IOB (HD)) and Table 29 (high-performance IOB (HP)) summarizes the values of standard-specific data input delay adjustments, output delays terminating at pads (based on standard) and 3-state delays.

- $T_{INBUF\_DELAY\_PAD\_I}$  is the delay from IOB pad through the input buffer to the I-pin of an IOB pad. The delay varies depending on the capability of the SelectIO input buffer.
- $T_{OUTBUF\_DELAY\_O\_PAD}$  is the delay from the O pin to the IOB pad through the output buffer of an IOB pad. The delay varies depending on the capability of the SelectIO output buffer.
- $T_{OUTBUF\_DELAY\_TD\_PAD}$  is the delay from the T pin to the IOB pad through the output buffer of an IOB pad, when 3-state is disabled. The delay varies depending on the SelectIO capability of the output buffer. In HP I/O banks, the internal DCI termination turn-on time is always faster than  $T_{OUTBUF\_DELAY\_TD\_PAD}$  when the DCITERMDISABLE pin is used. In HD I/O banks, the on-die termination turn-on time is always faster than  $T_{OUTBUF\_DELAY\_TD\_PAD}$  when the INTERMDISABLE pin is used.

## IOB 3-state Output Switching Characteristics

Table 30 specifies the values of  $T_{\text{OUTBUF\_DELAY\_TE\_PAD}}$  and  $T_{\text{INBUF\_DELAY\_IBUFDIS\_O}}$ .

- $T_{\text{OUTBUF\_DELAY\_TE\_PAD}}$  is the delay from the T pin to the IOB pad through the output buffer of an IOB pad, when 3-state is enabled (i.e., a high impedance state).
- $T_{\text{INBUF\_DELAY\_IBUFDIS\_O}}$  is the IOB delay from IBUFDISABLE to O output.
- In HP I/O banks, the internal DCI termination turn-off time is always faster than  $T_{\text{OUTBUF\_DELAY\_TE\_PAD}}$  when the DCITERMDISABLE pin is used.
- In HD I/O banks, the internal IN\_TERM termination turn-off time is always faster than  $T_{\text{OUTBUF\_DELAY\_TE\_PAD}}$  when the INTERMDISABLE pin is used.

**Notes:**

1. The input delay measurement methodology parameters for LVDCI/HSLVDCI are the same for LVCMOS standards of the same voltage. Parameters for all other DCI standards are the same for the corresponding non-DCI standards.
2. Input waveform switches between  $V_L$  and  $V_H$ .
3. Measurements are made at typical, minimum, and maximum  $V_{REF}$  values. Reported delays reflect worst case of these measurements.  $V_{REF}$  values listed are typical.
4. Input voltage level from which measurement starts.
5. This is an input voltage reference that bears no relation to the  $V_{REF}/V_{MEAS}$  parameters found in IBIS models and/or noted in [Figure 1](#).
6. The value given is the differential input voltage.

## Output Delay Measurement Methodology

Output delays are measured with short output traces. Standard termination was used for all testing. The propagation delay of the trace is characterized separately and subtracted from the final measurement, and is therefore not included in the generalized test setups shown in [Figure 1](#) and [Figure 2](#).

X16654-101316

Figure 1: Single-Ended Test Setup

X16640-101316

Figure 2: Differential Test Setup

Parameters  $V_{REF}$ ,  $R_{REF}$ ,  $C_{REF}$ , and  $V_{MEAS}$  fully describe the test conditions for each I/O standard. The most accurate prediction of propagation delay in any given application can be obtained through IBIS simulation, using this method:

1. Simulate the output driver of choice into the generalized test setup using values from [Table 32](#).
2. Record the time to  $V_{MEAS}$ .
3. Simulate the output driver of choice into the actual PCB trace and load using the appropriate IBIS model or capacitance value to represent the load.
4. Record the time to  $V_{MEAS}$ .
5. Compare the results of [step 2](#) and [step 4](#). The increase or decrease in delay yields the actual propagation delay of the PCB trace.

**Notes:**

1. This parameter indicates the total sampling error of the Kintex UltraScale+ FPGA DDR input registers, measured across voltage, temperature, and process. The characterization methodology uses the MMCM to capture the DDR input registers' edges of operation. These measurements include: CLK0 MMCM jitter, MMCM accuracy (phase offset), and MMCM phase shift resolution. These measurements do not include package or clock tree skew.

## Package Parameter Guidelines

The parameters in this section provide the necessary values for calculating timing budgets for clock transmitter and receiver data-valid windows.

### Notes:

1. These values represent the worst-case skew between any two SelectIO resources in the package: shortest delay to longest delay from die pad to ball.
2. Package delay information is available for these device/package combinations. This information can be used to deskew the package.

3. For speed grade -2LE, a 16-bit and 20-bit internal data path can only be used for line rates less than 8.1875 Gb/s when V<sub>CCINT</sub> = 0.85V or 6.25 Gb/s when V<sub>CCINT</sub> = 0.72V.
4. For speed grades -1E and -1I, a 16-bit and 20-bit internal data path can only be used for line rates less than 6.25 Gb/s.
5. For speed grade -1LI, a 16-bit and 20-bit internal data path can only be used for line rates less than 6.25 Gb/s when V<sub>CCINT</sub> = 0.85V or 5.15625 Gb/s when V<sub>CCINT</sub> = 0.72V.
6. When the gearbox is used, these maximums refer to the XCLK. For more information, see the *Valid Data Width Combinations for TX Asynchronous Gearbox* table in the *UltraScale Architecture GTY Transceiver User Guide* (UG578).

## Integrated Interface Block for Interlaken

More information and documentation on solutions using the integrated interface block for Interlaken can be found at [UltraScale Interlaken](#). The *UltraScale Architecture and Product Overview (DS890)* lists how many blocks are in each Kintex UltraScale+ FPGA. This section describes the following Interlaken configurations.

- 12 x 12.5 Gb/s protocol and lane logic mode ([Table 71](#)).
- 6 x 25.78125 Gb/s and 6 x 28.21 Gb/s protocol and lane logic mode ([Table 72](#)).
- 12 x 25.78125 Gb/s lane logic only mode ([Table 73](#)).

Kintex UltraScale+ FPGAs in the SFVB784, FFVA676, and FFVA1156 packages are only supported using the 12 x 12.5 Gb/s Interlaken configuration. See [Table 62](#) for the  $F_{GTYMAX}$  description.

**Notes:**

1. ADC offset errors are removed by enabling the ADC automatic offset calibration feature. The values are specified for when this feature is enabled.
2. See the *Analog Input* section in the *UltraScale Architecture System Monitor User Guide* ([UG580](#)).
3. When reading temperature values directly from the PMBus interface, the SYSMON has a  $+4^\circ\text{C}$  offset due to the transfer function used by the PMBus application. For example, the external REF temperature sensor error's range of  $\pm 3^\circ\text{C}$  becomes  $+1^\circ\text{C}$  to  $+7^\circ\text{C}$  when the temperature is read through the PMBus interface.
4. Supply sensor offset and gain errors are removed by enabling the automatic offset and gain calibration feature. The values are specified for when this feature is enabled.
5. See the *Adjusting the Acquisition Settling Time* section in the *UltraScale Architecture System Monitor User Guide* ([UG580](#)).
6. Any variation in the reference voltage from the nominal  $V_{\text{REFP}} = 1.25\text{V}$  and  $V_{\text{REFN}} = 0\text{V}$  will result in a deviation from the ideal transfer function. This also impacts the accuracy of the internal sensor measurements (i.e., temperature and power supply). However, for external ratiometric type applications allowing reference to vary by  $\pm 4\%$  is permitted.
