Kintex UltraScale+ FPGAs

BEST PRICE/PERFORMANCE/WATT FOR THE MID-RANGE

Kintex® UltraScale+™ devices deliver the industry’s most cost-effective solution for system performance-per-watt with ASIC-class serial connectivity. These devices expand the mid-range by delivering the highest throughput with lowest latency for medium-to-high volume applications that include wireless MIMO, NX100G networking, and DSP-intensive applications. Based on the ASIC-class advantage of the UltraScale™ architecture, Kintex UltraScale+ devices are co-optimized with the Vivado® Design Suite and leverage the UltraFAST™ design methodology to accelerate time to market.

RE-ARCHITECTING THE CORE FOR MASSIVE BANDWIDTH WITH THE ULTRASCALE ARCHITECTURE

The UltraScale+ families are based on the first all programmable architecture to span multiple nodes from planar through FinFET technologies, and from monolithic through 3D ICs. Xilinx UltraScale architecture provides diverse benefits and advantages to an array of markets and applications. The architecture combines enhancements in the configurable logic blocks (CLB), a dramatic increase in device routing, and a revolutionary ASIC-like clocking architecture, with high-performance DSP, memory interface PHYs, and serial transceivers. All UltraScale architecture-based FPGAs are capable of pushing the system performance-per-watt envelope enabling breakthrough speeds with high utilization. High system performance and multiple power reduction innovations make the UltraScale architecture the logical choice for many next-generation applications.

BUILDING ON THE SUCCESS OF XILINX’S ULTRASCALE PORTFOLIO

The UltraScale+ family of FPGAs, 3D ICs, and MPSoCs, combines UltraRAM, 3D-on-3D, and MPSoC technologies, delivering an extra node of value. To enable an even higher level of performance and integration, the UltraScale+ family also includes the IP interconnect optimization technology, SmartConnect. Built upon Xilinx’s UltraScale architecture, they leverage a significant boost in performance-per-watt using 16FF+ FinFET 3D transistors from the #1 service foundry in the world, TSMC. Xilinx provides scalability and package migration for the lowest risk and the highest value programmable technology.

TARGET APPLICATIONS

DATA CENTER
> Network Acceleration
> Storage Acceleration

INDUSTRIAL, SCIENCE, AND MEDICAL
> Medical Imaging
> Machine Vision

WIRED COMMUNICATIONS
> PON Access
> Optical Transport Network (OTN)

WIRELESS COMMUNICATIONS
> Radio
> Baseband
**FEATURES OVERVIEW**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>16nm low power FinFET+ process technology from TSMC</td>
<td>Industry-leading process from the #1 service foundry delivers a step function increase in performance-per-watt</td>
</tr>
<tr>
<td>UltraRAM for deep memory buffering</td>
<td>Up to 36Mb for SRAM device integration</td>
</tr>
<tr>
<td>SmartConnect technology</td>
<td>System-wide interconnect optimization tools and IP</td>
</tr>
<tr>
<td>Massive I/O bandwidth and dramatic latency reduction</td>
<td>50% greater serial bandwidth than Kintex UltraScale devices, and 4X greater than Kintex-7 devices</td>
</tr>
<tr>
<td>Enhanced routing, ASIC-class clocking, and efficient fabric</td>
<td>Enables breaking speeds with high utilization</td>
</tr>
<tr>
<td>Massive memory interface bandwidth</td>
<td>Next-generation DDR and serial memory support</td>
</tr>
<tr>
<td>Integrated blocks for PCI Express®</td>
<td>Complete end-to-end solution for multi-100G ports</td>
</tr>
<tr>
<td>Integrated 100G Ethernet MAC and 150G Interlaken cores</td>
<td>ASIC-class cores for breakthrough performance in packet processing</td>
</tr>
<tr>
<td>Enhanced DSP slices for diverse applications</td>
<td>Enabling a massive jump in fixed- and floating-point performance</td>
</tr>
<tr>
<td>High-speed memory cascading</td>
<td>Removes key bottlenecks in DSP and packet processing</td>
</tr>
<tr>
<td>Up to 50% power savings over Kintex-7 devices, and 30% power saving over Kintex UltraScale devices</td>
<td>Static- and dynamic-power optimizations at every level</td>
</tr>
<tr>
<td>Security</td>
<td>Enhanced features to protect IP and prevent tampering</td>
</tr>
</tbody>
</table>

- Over 2X performance-per-watt over Kintex-7 FPGAs
- The same scalable architecture and tools from Kintex UltraScale FPGAs
- For deep packet and video buffering
- 8X capacity-per-block vs. traditional embedded memory
- Deep-sleep power modes
- Matches optimal AXI interconnect to the design
- Automatic interface bridging
- Additional 20–30% advantage in performance-per-watt
- Smaller area and greater power consistency
- Up to two speed-grade advantage vs. comparable solutions
- Efficient CLB use and placement for reduced interconnect delay
- DDR4 support of up to 2,666Mb/s
- Support for server-class DIMMs (8X capacity vs. Kintex-7)
- Hybrid Memory Cube serial memory support of up to 30G
- Gen3 x16 and Gen4 x8 for 100G bandwidth per block
- Expanded virtualization for data center applications
- Enhanced tag management for increased buffer space
- Up to 6.3TeraMACs of bandwidth at 891MHz operation
- Double-precision floating point using 30% fewer resources
- Complex fixed-point arithmetic in half the resources
- Eliminates fabric usage when building deep memories
- Reduces routing congestion
- Lowers dynamic power consumption
- Optimal voltage tuning
- Power-optimized transceivers and block RAM
- More granular clock gating of logic fabric and block RAM
- AES-GCM decryption, RSA-2048 authentication
- DPA countermeasures and permanent tamper penalty
- Improved SEU performance
