About This Guide

The goal of this tutorial is to provide a quick introduction to SmartXplorer and how its capabilities can be used to help achieve timing closure.

This tutorial is delivered in two forms, each centered on the main user flow using the ISE® design tools:

- The first is targeted to ISE Project Navigator users.
In this section we show how SmartXplorer can be used from Project Navigator.
- The second is targeted to command line users.
Since a majority of Microsoft Windows users use Xilinx® tools from the ISE Project Navigator environment, for command line users we will mainly focus on using SmartXplorer on the Linux platform. Of course, you can easily adapt the provided material for Microsoft Windows operating systems, if required.

Both forms contain a similar set of labs, each with step-by-step exercises allowing you to learn different aspects of SmartXplorer.

Starting with the 12.1 release, SmartXplorer supports Xilinx Synthesis Technology (XST) and Synplify synthesis tools. Before running multiple implementation strategies you can now execute several synthesis strategies in order to select the best synthesized netlist for implementation runs. It is not mandatory to use synthesis with SmartXplorer - you may continue to use SmartXplorer for implementation only. Using SmartXplorer with implementation flow only is also covered in this tutorial.

See the *Command Line Tools User Guide* for more information regarding Synplify support.

Note: Synthesis in SmartXplorer is supported in command line mode only. It is not supported from the ISE environment. Not every SmartXplorer option and functionality is covered in this tutorial.

Guide Contents

This manual contains the following chapters:

- [Chapter 1, SmartXplorer Overview](#), describes the capabilities of SmartXplorer.
- [Chapter 2, Tutorial Description](#), provides general information about the features covered in each lab. We also describe the time required to complete each lab segment.
- [Chapter 3, Preparing Designs for Labs](#), contains instructions on how to obtain the designs for each lab.
- Chapters 4, 5, and 6 contain detailed information for each lab, and each includes an overall summary for that lab segment as well as the detailed instructions required for you to complete the lab.
- [Chapter 4, Lab 1: Basic Flow](#)
- [Chapter 5, Lab 2: Creating Custom Strategies](#)

- [Chapter 6, Lab 3: Running Multiple Strategies in Parallel](#)
- [Appendix A, Custom Files](#), provides examples for a custom strategy file and host list files. In addition, it contains a set of SmartXplorer configurations dedicated to various tasks.
- [Appendix B, Creating XST Script File](#), shows how to quickly create an XST script file in order to run SmartXplorer with XST synthesis.

Additional Resources

To find additional documentation, see the Xilinx® Web site at:

<http://www.xilinx.com/support/documentation/index.htm>.

To search the Answer Database of silicon, software, and IP questions and answers, or to create a technical support WebCase, see the Xilinx Web site at:

<http://www.xilinx.com/support/mysupport.htm>.

Conventions

This document uses the following conventions. An example illustrates each convention.

Typographical

The following typographical conventions are used in this document:

Convention	Meaning or Use	Example
Courier font	Messages, prompts, and program files that the system displays	speed grade: - 100
Courier bold	Literal commands that you enter in a syntactical statement	ngdbuild <i>design_name</i>
Helvetica bold	Commands that you select from a menu	File → Open
	Keyboard shortcuts	Ctrl+C
Italic font	Variables in a syntax statement for which you must supply values	ngdbuild <i>design_name</i>
	References to other manuals	See the <i>Development System Reference Guide</i> for more information.
	Emphasis in text	If a wire is drawn so that it overlaps the pin of a symbol, the two nets are <i>not</i> connected.
Square brackets []	An optional entry or parameter. However, in bus specifications, such as bus [7:0] , they are required.	ngdbuild [<i>option_name</i>] <i>design_name</i>

Convention	Meaning or Use	Example
Braces { }	A list of items from which you must choose one or more	lowpwr = { on off }
Vertical bar	Separates items in a list of choices	lowpwr = { on off }
Vertical ellipsis . . .	Repetitive material that has been omitted	IOB #1: Name = QOUT' IOB #2: Name = CLKIN' . . .
Horizontal ellipsis ...	Repetitive material that has been omitted	allow block <i>block_name loc1 loc2 ... locn;</i>

Online Document

The following conventions are used in this document:

Convention	Meaning or Use	Example
Blue text	Cross-reference link to a location in the current document	See the section " Additional Resources " for details. Refer to " Title Formats " in Chapter 1 for details.
Blue, underlined text	Hyperlink to a Web site (URL)	Go to http://www.xilinx.com for the latest speed files.

SmartXplorer Overview

Introduction

Delivering timing closure in the shortest amount of time is the ultimate SmartXplorer goal.

Timing closure is undoubtedly one of the most challenging aspects in modern FPGA design. Xilinx® is committed to assisting designers overcome timing challenges by:

- Improving synthesis and implementation algorithms
- Providing powerful graphical analysis tools such as PlanAhead™ software and FPGA Editor

Although FPGA tools have become easier to use while offering ever more advanced features, it is difficult to anticipate all design situations. Some may stay hidden until the very last stages of a design cycle.

Regardless of their experience level, designers usually try to explore several possibilities by changing different tool options before deciding to make a change in their HDL code or trying placement constraints. Changing tool operations is a very easy thing to do. The main question facing this designer is this: How can a better set of options be identified in the first place?

Key Benefits

SmartXplorer has two key features:

- It automatically performs design exploration by using a set of built-in or user-created implementation strategies to try to meet timing.
Note: A design strategy is a set of tool options and their corresponding values that are intended to achieve a particular design goal such as area, speed, or power.
- It allows running these strategies in parallel on multiples machines, completing the job much faster.

Design Strategies

SmartXplorer is delivered with a set of predefined, built-in strategies. These strategies are tuned and selected separately for each FPGA family. This selection is revised for each major release to ensure that we have the best possible correlation with current software version.

Many designers create their own design strategies or scripts based on their experience. SmartXplorer allows users to integrate these custom strategies into the system and either use them exclusively or combine with some predefined strategies.

SmartXplorer is not simply a tool to use during the late, time-limited portion of the design cycle. It can be used during the entire project cycle preventing or reducing emergency situations at the end of the design cycle. We suggest running it on a regular basis to monitor your design and ensure timing results stay within an acceptable range.

Exploiting Parallel Compute Platforms

Executing several design strategies (jobs) in parallel is a powerful feature which allows designers to complete the project faster. This specific nature of this feature depends on the operating system in use.

Linux OS

SmartXplorer can run multiple jobs in parallel on different machines across the network. This can be done in two ways:

- You have a regular Linux network: in this case SmartXplorer manages the jobs distribution across the network. You must provide a list of machines which can be used.
- SmartXplorer supports **LSF** (Load Sharing Facility) or **SGE** (Sun Grid Engine) compute farms. In this case LSF or SGE manages jobs distribution. You must specify the number of machines which can be simultaneously allocated to SmartXplorer.

If you do not have access to the Linux network, but you have a personal Linux machine with multi-core processor or several processors, you can still run several jobs in parallel on this machine.

Microsoft Windows OS

In the current release, SmartXplorer allows several strategies to be run in parallel on a single Windows machine, if it has a multi-core processor or several processors.

Using a Single Linux or Windows Machine

If you do not have access to multiple Linux servers on a network and can only use your local computer, make sure your machine has at least one multi-core processor or several processors.

First of all, you have to estimate how many jobs your machine may run simultaneously.

Theoretically, the number of jobs you may run in parallel can be calculated in the following way:

$$\text{Nb_Of_Jobs} = P * C$$

Where **P** is the number of processors and **C** is the number of cores per processor.

If you have 4 dual-core processors, then you may run 8 jobs in parallel.

However, depending on the available memory, its speed, the speed of your hard drive, etc., your computer might not be able to deal with the maximum number of jobs calculated using the above formula.

Depending on your calculations, following are some tips you may use:

Tip1: If due to the memory requirements of your design, your machine can run only a single strategy at a time, then you will need to run all strategies sequentially. This is a good situation for using an overnight run of SmartXplorer.

Tip2: When trying to solve timing problems, you can work on smaller blocks separately from the rest of the design. Your machine might be able to deal with multiple strategies in parallel for these blocks. If this is the case, parallel jobs can save you a lot of time.

Tutorial Description

Throughout the tutorials, we use a small design to allow you to complete the labs as quickly as possible. Less than 40 minutes is required to complete the entire tutorial, which covers all the major features of SmartXplorer.

We strongly suggest running the labs in order (Lab1, Lab2, Lab3). However, the labs are independent and therefore can be run out of order if you wish to immediately focus on one particular functional area.

SmartXplorer has two key features:

1. It helps to achieve timing closure by using the predefined built-in or user-defined design strategies.
2. It allows running these strategies in parallel on multiple machines, completing the job much faster.

For the sake of clarity these two key features are represented separately within this tutorial:

- Lab1 and Lab2 are dedicated to the aspects of timing closure. All design strategies in these labs will be run sequentially (the feature that allows running several strategies in parallel will be *intentionally disabled*).
- In contrast, Lab3 is dedicated to running multiple strategies in parallel.

The following table gives you a brief overview of all the labs:

Table 2-1: Lab Overview

Title	Duration	Covered Features
Lab 1: Basic Flow	25 min	<ul style="list-style-type: none"> • How SmartXplorer can be easily launched (synthesis and implementation) • How final results are reported, stored and can be further used • How to run additional iterations to improve upon previously obtained • How to configure SmartXplorer to run the predefined strategies and additional iterations at once (for example, overnight runs) • How to run SmartXplorer with implementation flow only
Lab 2: Creating Custom Strategies	5 min	<ul style="list-style-type: none"> • How to create a custom strategy file and use it in SmartXplorer
Lab 3: Running Multiple Strategies in Parallel	10 min	<ul style="list-style-type: none"> • How to run several strategies in parallel

Knowledge Prerequisites

The labs require some basic knowledge of the major steps of the Xilinx[®] FPGA implementation flow and how to run them: Synthesis, Translate (NGDBuild), Map, Place & Route, and Timing Analysis (TRCE).

Preparing Designs for Labs

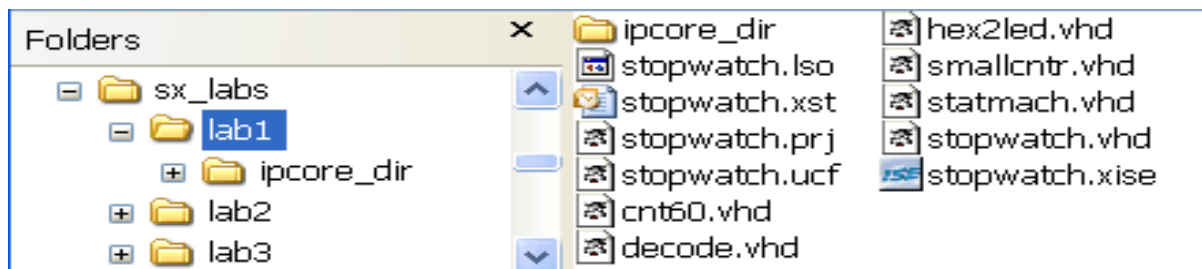

This section provides detailed instructions on how to prepare the design for each lab.

Design Description

You will use the small **stopwatch** design throughout this tutorial for each lab, targeting a Spartan®-6 xc6slx4-3-tqg144 device.

Instructions

1. Download **UG688.zip** file from [here](#).
2. Create an **sx_labs** directory, where you will store all SmartXplorer lab data.
3. Copy the **UG688.zip** file to the **sx_labs** directory.
4. Unzip the **UG688.zip** file. Ultimately, you should have a directory structure similar to the following view:

Lab 1: Basic Flow

Scope

Objectives

The goal of this 25-minute lab is to cover:

- How to run each of the predefined SmartXplorer Strategies (synthesis and implementation).
- How final results are reported, stored, and can be further used.
- How to run additional iterations based on the previously obtained results to improve timing.
- How to run SmartXplorer with implementation flow only.

Background

Starting with the 12.1 release, SmartXplorer supports Xilinx Synthesis Technology (XST) and Synplify synthesis tools. Before running multiple implementation strategies you can now execute several synthesis strategies in order to select the best synthesized netlist for implementation runs. It is not mandatory to use synthesis with SmartXplorer - you may continue to use SmartXplorer for implementation.

Important: In this tutorial:

- We will first focus on using both synthesis (XST) and implementation flows with SmartXplorer
- We will also cover how SmartXplorer can be used with implementation flow only.

When you use synthesis with SmartXplorer, the execution becomes a two phase process that includes synthesis and implementation.

- Phase 1 (Synthesis) - During this phase, SmartXplorer runs a set of synthesis strategies in order to identify the best synthesized netlist from performance point of view. Please note that in the current release, the synthesis tools do not generate a timing score allowing to select the best results. Each synthesized netlist is run through a single MAP and PAR (further referred as Quick Implementation) using a strategy optimized for runtime in order to obtain a timing score for each netlist.

Note: The Quick Implementation strategy is one of the predefined implementation SmartXplorer strategies.

- Phase 2 (Implementation) - During this phase SmartXplorer selects the best synthesized netlist and runs a set of implementation strategies to meet timing requirements.

If SmartXplorer is used with implementation flow only, then only Phase 2 of SmartXplorer flow is active.

Lab

Step 1: Setup Xilinx Environment

1. Open a terminal window and setup the Xilinx® environment.
2. Go to the lab1 directory: `cd ../lab1`

Step 2: Run SmartXplorer with Mandatory Options

To run SmartXplorer (**smartxplorer**) you have to specify the following mandatory options:

- A target device: **-p xc6slx4-3-tgg144**
- A UCF constraint file: **-uc stopwatch.ucf**
- An XST script file: **stopwatch.xst**

Note: Creation of XST script file is described in Appendix B.

In addition, we will use the following two options:

- Our design contains an external core (**tenth.ngc**) located in the **ipcore_dir** directory. We will use the **-sd** switch to reference to this directory.
- For the sake of clarity SmartXplorer will store its results in the **smartxplorer_results** directory: **-wd smartxplorer_results**

Now we are ready to run SmartXplorer.

1. In the current Terminal window, launch SmartXplorer using the following command:

```
smartxplorer -p xc6slx4-3-tgg144 -uc stopwatch.ucf -wd
smartxplorer_results -sd ipcore_dir stopwatch.xst
```

Once running, SmartXplorer creates a status table to display progress and the final results summary. Each row in this table represents one of the predefined SmartXplorer strategies. This can be seen:

- In the Terminal Window
- in the **smartxplorer.html** HTML file, located in the **smartxplorer_results** directory. You should use a Web browser to open this file.

These tables are progressively updated during SmartXplorer run. Following is an example of an intermediate status (**smartxplorer.html**):

Strategy	Host	Output	Status	Timing Score	Luts	Slice Registers	Total RunTime
XSTOptReshRedcon_MapRunTime	host_1	run1	Done	2118	30 (1%)	29 (1%)	0h 1m 5s
XSTOptOnehot_MapRunTime	host_1	run2	Mapping	None	None	None	0h 0m 14s
XSTOnehot_MapRunTime	None	None	None	None	None	None	None
XSTOptOnehotRedcon_MapRunTime	None	None	None	None	None	None	None
XSTRegbalOptOnehot_MapRunTime	None	None	None	None	None	None	None
XSTOnehotRedcon_MapRunTime	None	None	None	None	None	None	None
XSTRegbalOptOnehotReshRedcon_MapRunTime	None	None	None	None	None	None	None

During the synthesis phase SmartXplorer shows all (seven) synthesis strategies with the Quick Implementation strategy which is used to obtain the timing score.

Note: The strategy in the left column represents the combination of synthesis and Quick Implementation strategy separated by an underscore ("_"). For example, XSTOptReshRedcon_MapRunTime means that the name of the synthesis strategy is XSTOptReshRedcon and the name of the Quick Implementation strategy is MapRunTime.

As you can see from the **Done** status in the Status column, **XSTOptReshRedcon_MapRunTime** has been completed. The process took 1 minute and 5 seconds and the final timing score is 2118 (timing constraints were not met). This row has a green background, meaning that, so far, this strategy provides the best timing results in the current SmartXplorer session.

XSTOptReshRedcon_MapRunTime strategy is still running and it is going through the Mapping step.

Note: To stop SmartXplorer execution before it completes all strategies, press CTRL-C in the Terminal window.

As soon as all synthesis strategies are completed, SmartXplorer selects the best netlist based on timing score and runs it using remaining built-in predefined implementation strategies updating the HTML report:

Strategy	Host	Output	Status	Timing Score	Luts	Slice Registers	Total RunTime
XSTOptReshRedcon_MapRunTime	host_1	run1	Done	2118	30 (1%)	29 (1%)	0h 1m 5s
XSTOptOnehot_MapRunTime	host_1	run2	Done	1895	30 (1%)	32 (1%)	0h 0m 54s
XSTOnehot_MapRunTime	host_1	run3	Done	1895	30 (1%)	32 (1%)	0h 0m 59s
XSTOptOnehotRedcon_MapRunTime	host_1	run4	Done	1895	30 (1%)	32 (1%)	0h 0m 50s
XSTRegbalOptOnehot_MapRunTime	host_1	run5	Done	1895	30 (1%)	32 (1%)	0h 0m 54s
XSTOnehotRedcon_MapRunTime	host_1	run6	Done	1895	30 (1%)	32 (1%)	0h 0m 49s
XSTRegbalOptOnehotReshRedcon_MapRunTime	host_1	run7	Done	1895	30 (1%)	32 (1%)	0h 0m 54s
XSTOnehotRedcon_MapGlobOptLogOptRegDup	host_1	run8	Done	34	48 (2%)	32 (1%)	0h 0m 44s
XSTOnehotRedcon_MapGlobOptIOReg	host_1	run9	Mapping	None	None	None	0h 0m 11s
XSTOnehotRedcon_MapRegDup	None	None	None	None	None	None	None
XSTOnehotRedcon_MapExtraEffortIOReg	None	None	None	None	None	None	None
XSTOnehotRedcon_MapLogOptRegDup	None	None	None	None	None	None	None
XSTOnehotRedcon_MapExtraEffort2	None	None	None	None	None	None	None

In this example, the XSTOnehotRedcon synthesis strategy (run6) was selected as the best after 7 runs as it has the smallest timing score and runtime. This strategy is used to run 6 implementation strategies (run8 to run13). After all runs are completed the best strategy is highlighted using green (run8):

Strategy	Host	Output	Status	Timing Score	Luts	Slice Registers	Total RunTime
XSTOptReshRedcon_MapRunTime	host_1	run1	Done	2118	30 (1%)	29 (1%)	0h 1m 5s
XSTOptOnehot_MapRunTime	host_1	run2	Done	1895	30 (1%)	32 (1%)	0h 0m 54s
XSTOnehot_MapRunTime	host_1	run3	Done	1895	30 (1%)	32 (1%)	0h 0m 59s
XSTOptOnehotRedcon_MapRunTime	host_1	run4	Done	1895	30 (1%)	32 (1%)	0h 0m 50s
XSTRegbalOptOnehot_MapRunTime	host_1	run5	Done	1895	30 (1%)	32 (1%)	0h 0m 54s
XSTOnehotRedcon_MapRunTime	host_1	run6	Done	1895	30 (1%)	32 (1%)	0h 0m 49s
XSTRegbalOptOnehotReshRedcon_MapRunTime	host_1	run7	Done	1895	30 (1%)	32 (1%)	0h 0m 54s
XSTOnehotRedcon_MapGlobOptLogOptRegDup	host_1	run8	Done	34	48 (2%)	32 (1%)	0h 0m 44s
XSTOnehotRedcon_MapGlobOptIOReg	host_1	run9	Done	5784	48 (2%)	22 (1%)	0h 0m 45s
XSTOnehotRedcon_MapRegDup	host_1	run10	Done	561	30 (1%)	32 (1%)	0h 0m 39s
XSTOnehotRedcon_MapExtraEffortIOReg	host_1	run11	Done	4283	30 (1%)	22 (1%)	0h 0m 39s
XSTOnehotRedcon_MapLogOptRegDup	host_1	run12	Done	701	30 (1%)	32 (1%)	0h 0m 39s
XSTOnehotRedcon_MapExtraEffort2	host_1	run13	Done	784	30 (1%)	32 (1%)	0h 0m 39s

- Click on the [run2](#) link in the Output column of the **XSTOptOnehot_MapRunTime** strategy to open a strategy log file: **stopwatch_sx.log** (it contains XST, MAP, Place & Route and TRCE reports).

```
#####
WARNING: p,opt_level,fsm_encoding option(s) in xst file will be overridden
by the new values provided in strategy XSTOptOnehot_MapRunTime.
#####
```

Command Line :

```
xst C:\sx_labs\lab1\smartexplorer_results\run2\stopwatch.xst
-ifn C:\sx_labs\lab1\smartexplorer_results\run2\stopwatch.xst
```

```
Release 12.2 - xst M.63c (nt)

```

TABLE OF CONTENTS

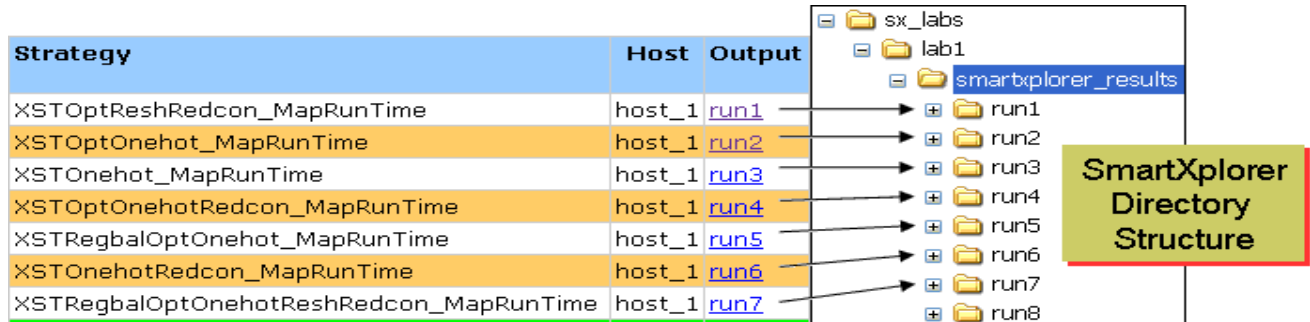

- 1) Synthesis Options Summary
- 2) HDL Parsing
- 3) HDL Elaboration
- 4) HDL Synthesis
 - 4.1) HDL Synthesis Report

- Click on the [1895](#) link in the Timing Score column of the **XSTOptOnehot_MapRunTime** strategy to open a timing report summary.

**Asterisk (*) preceding a constraint indicates it was not met.
This may be due to a setup or hold violation.**

Constraint	Check	Worst Case Slack	Best Case Achievable	Timing Errors	Timing Score
TS_CLK = PERIOD TIMEGRP "CLK" 2.3 ns HIGH 50%	SETUP	-0.387	2.687	14	1895
	HOLD	0.266		0	0

- Review the results directory structure. All SmartXplorer results are stored in the `smartxplorer_results` directory. Each SmartXplorer strategy is stored in a separate directory: `run1`, `run2`, etc.

IMPORTANT: If you want to restart SmartXplorer, you should close all reports in text editors opened for SmartXplorer results first. SmartXplorer removes all previously generated data files before each start. If one of the reports is not closed, SmartXplorer might fail to clean up previously generated results. In this case, it will issue a **permission denied** error in Terminal window and stop execution.

```
ERROR: SmartXplorer could not clean up directory run1 from previous run. Please
ensure that no other programs are using this directory.
```

Step 3: Running Additional Iterations to Improve Timing

In the previous step, the `XSTOnehotRedcon_MapGlobOptLogOptRegDup` strategy gave the best timing result. We will run it 5 additional times (implementation flow only) with different Cost Tables to further improve timing (please refer to the *Command Line Tools User Guide* for more information on cost tables).

- To run the `XSTOnehotRedcon_MapGlobOptLogOptRegDup` strategy 5 additional times, we must use the Variability Passes option: `-vp 5`.
- We have to specify MAP and PAR options from the `XSTOnehotRedcon_MapGlobOptLogOptRegDup` strategy using the `-mo` and `-po` options respectively. These options can be found in the `smartxplorer.txt` file located in the `smartxplorer_results` directory. This file contains the options for all previously run strategies.

```
-----
Strategy : XSTOnehotRedcon_MapGlobOptLogOptRegDup
-----
Run index   : run8
Xst options : -fsm_encoding one-hot -reduce_control_sets auto
Map Options : -ol high -xe n -global_opt speed -logic_opt on
              -register_duplication on -w
Par options  : -ol high -xe n
```

Taking into account that originally the `XSTOnehotRedcon_MapGlobOptLogOptRegDup` strategy was run with default

Cost Table of 1, we now choose to set starting placer cost table to 2: **-t 2**. These options must be added to the MAP and PAR commands:

```
-mo "-timing -ol high -xe n -global_opt speed -logic_opt
-register_duplication on -w -t 2"
-po "-ol high -xe n"
```

3. Finally, to run the implementation flow 5 additional times we must use a synthesized netlist (**stopwatch.ngc**) instead of XST script (**stopwatch.xst**) as the input file for SmartXplorer.

Copy **stopwatch.ngc** from the **smartxplorer_results/run6** to the current (**lab1**) directory: **cp smartxplorer_results/run6/stopwatch.ngc** .

4. In the current Terminal window, launch SmartXplorer using the following command:

```
smartxplorer -p xc6slx4-3-tgg144 -uc stopwatch.ucf -wd
smartxplorer_results -sd ipcore_dir -vp 5 -mo "-ol high -xe n
-global_opt speed -logic_opt on -register_duplication on -w -t 2" -po
"-ol high -xe n" stopwatch.ngc
```

Strategy	Host	Output	Status	Timing Score	Luts	Slice Registers	Total RunTime
MapRunTime*	host_1	run1	Done	129	48 (2%)	32 (1%)	0h 0m 44s
MapRunTimeCT3*	host_1	run2	Done	0	48 (2%)	32 (1%)	0h 0m 44s

As you can see, only 2 strategies were run. The main reason is that by default SmartXplorer stops strategies execution as soon as timing constraints are met. This is the case for iteration with Cost Table 3: MapRunTimeCT3. You can use the **-ra** (Run All) option to run all iterations and get the complete picture on the relative performance of each cost table.

Step 4: Run the Predefined Strategies and Additional Iterations at Once

In the previous steps, we were able to meet timing constraints using a 2-phase approach. In the first phase, [Step 2: Run SmartXplorer with Mandatory Options](#), we ran all predefined strategies and identified the best one. In the second phase, [Step 3: Running Additional Iterations to Improve Timing](#), we selected the best strategy from the first phase and iterated it by changing cost tables.

The same results can be achieved by launching SmartXplorer only once. This is a very useful approach to running jobs overnight.

The same procedure can be achieved in a single phase. This is a very useful approach to running jobs overnight.

1. Specify Maximum number of runs equal to 18 (13 predefined + 5 additional iterations): **-m 18**.
2. Use the **-ra** (Run All) option to get the complete picture.
3. In the current Terminal window launch SmartXplorer using the following command:

```
smartxplorer -p xc6slx4-3-tgg144 -uc stopwatch.ucf -wd
smartxplorer_results -sd ipcore_dir -m 18 -ra stopwatch.xst
```

You will receive the following final results:

Strategy	Host	Output	Status	Timing Score	Luts	Slice Registers	Total RunTime
XSTOptReshRedcon_MapRunTime	host_1	run1	Done	2118	30 (1%)	29 (1%)	0h 1m 19s
XSTOptOnehot_MapRunTime	host_1	run2	Done	1895	30 (1%)	32 (1%)	0h 0m 54s
XSTOnehot_MapRunTime	host_1	run3	Done	1895	30 (1%)	32 (1%)	0h 0m 49s
XSTOptOnehotRedcon_MapRunTime	host_1	run4	Done	1895	30 (1%)	32 (1%)	0h 0m 54s
XSTRegbalOptOnehot_MapRunTime	host_1	run5	Done	1895	30 (1%)	32 (1%)	0h 0m 54s
XSTOnehotRedcon_MapRunTime	host_1	run6	Done	1895	30 (1%)	32 (1%)	0h 0m 49s
XSTRegbalOptOnehotReshRedcon_MapRunTime	host_1	run7	Done	1895	30 (1%)	32 (1%)	0h 0m 55s
XSTOnehotRedcon_MapGlobOptLogOptRegDup	host_1	run8	Done	34	48 (2%)	32 (1%)	0h 0m 49s
XSTOnehotRedcon_MapGlobOptIOReg	host_1	run9	Done	5784	48 (2%)	22 (1%)	0h 0m 44s
XSTOnehotRedcon_MapRegDup	host_1	run10	Done	561	30 (1%)	32 (1%)	0h 0m 40s
XSTOnehotRedcon_MapExtraEffortIOReg	host_1	run11	Done	4283	30 (1%)	22 (1%)	0h 0m 40s
XSTOnehotRedcon_MapLogOptRegDup	host_1	run12	Done	701	30 (1%)	32 (1%)	0h 0m 40s
XSTOnehotRedcon_MapExtraEffort2	host_1	run13	Done	784	30 (1%)	32 (1%)	0h 0m 40s
XSTOnehotRedcon_MapGlobOptLogOptRegDupCT2	host_1	run14	Done	129	48 (2%)	32 (1%)	0h 0m 44s
XSTOnehotRedcon_MapGlobOptLogOptRegDupCT3	host_1	run15	Done	0	48 (2%)	32 (1%)	0h 0m 44s
XSTOnehotRedcon_MapGlobOptLogOptRegDupCT4	host_1	run16	Done	0	48 (2%)	32 (1%)	0h 0m 44s
XSTOnehotRedcon_MapGlobOptLogOptRegDupCT5	host_1	run17	Done	0	48 (2%)	32 (1%)	0h 0m 44s
XSTOnehotRedcon_MapGlobOptLogOptRegDupCT6	host_1	run18	Done	0	48 (2%)	32 (1%)	0h 0m 44s

Step 5: Using SmartXplorer with Implementation Flow Only

As it was mentioned before, it is not mandatory to use synthesis with SmartXplorer - you may use SmartXplorer for implementation flow only. In this step we will see how to run seven built-in predefined implementation strategies.

1. To run implementation flow only we must use a synthesized netlist (**stopwatch.ngc**) instead of XST script (**stopwatch.xst**) as the input file for SmartXplorer. Copy **stopwatch.ngc** from the **smartxplorer_results/run6** to the current (**lab1**) directory: **cp smartxplorer_results/run6/stopwatch.ngc**
2. In the current Terminal window, launch SmartXplorer using the following command:

```
smartxplorer -p xc6slx4-3-tgg144 -uc stopwatch.ucf -wd
smartxplorer_results -sd ipcore_dir stopwatch.ngc
```

You will receive the following final results:

Strategy	Host	Output	Status	Timing Score	Luts	Slice Registers	Total RunTime
MapRunTime	host_1	run1	Done	1895	30 (1%)	32 (1%)	0h 1m 0s
MapGlobOptLogOptRegDup	host_1	run2	Done	34	48 (2%)	32 (1%)	0h 0m 50s
MapGlobOptIOReg	host_1	run3	Done	5784	48 (2%)	22 (1%)	0h 0m 44s
MapRegDup	host_1	run4	Done	561	30 (1%)	32 (1%)	0h 0m 40s
MapExtraEffortIOReg	host_1	run5	Done	4283	30 (1%)	22 (1%)	0h 0m 40s
MapLogOptRegDup	host_1	run6	Done	701	30 (1%)	32 (1%)	0h 0m 40s
MapExtraEffort2	host_1	run7	Done	784	30 (1%)	32 (1%)	0h 0m 40s

Conclusion

In this lab, we ran SmartXplorer with synthesis and implementation flow and obtained results for the predefined strategies.

We then ran the best strategy five additional times with different Cost Tables to further improve timing.

Afterwards, we showed how to run the predefined strategies and additional runs in a single pass.

Finally, we demonstrated how to run SmartXplorer with implementation flow only.

Lab 2: Creating Custom Strategies

Objectives

Working on your design and running the seven predefined strategies you found out that two of them always gave you much better results than the other five. Therefore, for future runs, you ultimately choose to run only those two strategies and skip the others.

Alternatively, you may have manually found a set of strategies which give you the best results for your design and now you would like to use these strategies with SmartXplorer.

In both cases, you can create a *custom* strategy file and use it in SmartXplorer.

The goal of this 5-minute lab is to show how custom strategies can be created and run from SmartXplorer.

Lab

Step 1: Setup Xilinx Environment

1. Open a terminal window and setup the Xilinx[®] environment.
2. Go to the **lab2** directory: `cd ../lab2`

Step 2: Identify the Best Two Strategies

In Lab 1, we acquired the following results for predefined strategies, where

- two synthesis strategies **XSTOnehotRedcon** and **XSTOptOnehotRedcon** and
- two implementation strategies **MapGlobOptLogOptRegDup** and **MapRegDup** were the best ones:

Strategy	Host	Output	Status	Timing Score	Luts	Slice Registers	Total RunTime
XSTOptReshRedcon_MapRunTime	host_1	run1	Done	2118	30 (1%)	29 (1%)	0h 1m 5s
XSTOptOnehot_MapRunTime	host_1	run2	Done	1895	30 (1%)	32 (1%)	0h 0m 54s
XSTOnehot_MapRunTime	host_1	run3	Done	1895	30 (1%)	32 (1%)	0h 0m 59s
XSTOptOnehotRedcon_MapRunTime	host_1	run4	Done	1895	30 (1%)	32 (1%)	0h 0m 50s
XSTRegbalOptOnehot_MapRunTime	host_1	run5	Done	1895	30 (1%)	32 (1%)	0h 0m 54s
XSTOnehotRedcon_MapRunTime	host_1	run6	Done	1895	30 (1%)	32 (1%)	0h 0m 49s
XSTRegbalOptOnehotReshRedcon_MapRunTime	host_1	run7	Done	1895	30 (1%)	32 (1%)	0h 0m 54s
XSTOnehotRedcon_MapGlobOptLogOptRegDup	host_1	run8	Done	34	48 (2%)	32 (1%)	0h 0m 44s
XSTOnehotRedcon_MapGlobOptIOReg	host_1	run9	Done	5784	48 (2%)	22 (1%)	0h 0m 45s
XSTOnehotRedcon_MapRegDup	host_1	run10	Done	561	30 (1%)	32 (1%)	0h 0m 39s
XSTOnehotRedcon_MapExtraEffortIOReg	host_1	run11	Done	4283	30 (1%)	22 (1%)	0h 0m 39s
XSTOnehotRedcon_MapLogOptRegDup	host_1	run12	Done	701	30 (1%)	32 (1%)	0h 0m 39s
XSTOnehotRedcon_MapExtraEffort2	host_1	run13	Done	784	30 (1%)	32 (1%)	0h 0m 39s

Step 3: Creating the Custom Strategy File

Before we can create a custom strategy file based on the selected strategies, we must find out the set of options SmartXplorer used for these strategies.

This information is stored in the **smartexplorer.txt** file located in the **smartexplorer_results** directory of Lab 1. This file contains the options for all previously run strategies. The contents of this file can be found in the following location:

1. **lab1_smartexplorer.txt** file located in the **lab2** directory.

```

-----
Strategy : XSTOnehotRedcon_MapRunTime
-----
Run index   : run6
Xst options : -fsm_encoding one-hot -reduce_control_sets auto
Map options : -ol high -w
Par options : -ol high

-----
Strategy : XSTRegbalOptOnehotReshRedcon_MapRunTime
-----
Run index   : run7
Xst options : -register_balancing yes -opt_level 2 -fsm_encoding one-hot
             -resource_sharing no -reduce_control_sets auto

Map options : -ol high -w
Par options : -ol high

-----
Strategy : XSTOnehotRedcon_MapGlobOptLogOptRegDup
-----
Run index   : run8
Xst options : -fsm_encoding one-hot -reduce_control_sets auto
Map options : -ol high -xe n -global_opt speed -logic_opt on
             -register_duplication on -w

Par options : -ol high -xe n

-----
Strategy : XSTOnehotRedcon_MapRegDup
-----
Run index   : run10
Xst options : -fsm_encoding one-hot -reduce_control_sets auto
Map options : -ol high -xe n -register_duplication on -w
Par options : -ol high -xe n

```

2. Using the above information, we can create a strategy file. In addition, we will rename:
 - The **XSTOnehotRedcon** and **XSTOptOnehotRedcon** synthesis strategies, using the names **Syn1** and **Syn2**, respectively.
 - The **MapGlobOptLogOptRegDup** and **MapRegDup** implementation strategies, using the names **Impl1** and **Impl2**, respectively.

Open **my_strategy.txt** file located in **lab2** directory. This file contains Syn1, Syn2, Impl1 and Impl2 definitions:

```

{
  "spartan6":
  (
    {"name": "Syn1", "xst": "-fsm_encoding one-hot -reduce_control_sets auto"},
    {"name": "Syn2", "xst": "-register_balancing yes -opt_level 2 -fsm_encoding
one-hot -resource_sharing no -reduce_control_sets auto"},
    ),
    "MAP-Par options":
    (
      {"name": "Impl1",
      "map": "-ol high -xe n -global_opt speed -logic_opt on -register_duplication
on -w",
      "par": "-ol high -xe n"},
      {"name": "Impl2",
      "map": "-ol high -xe n -register_duplication on -w",
      "par": "-ol high -xe n"},
    ),
  },
}

```

- Specify the **my_strategy.txt** file via **-sf** switch in SmartXplorer command.
- In the current terminal window, launch SmartXplorer using the following command:

```
smartxplorer -p xc6slx4-3-tqg144 -uc stopwatch.ucf -wd
smartxplorer_results -sd ipcore_dir -sf my_strategy.txt stopwatch.xst
```
- SmartXplorer generates the following results (see **smartxplorer.html**):

Strategy	Host	Output	Status	Timing Score	Luts	Slice Registers	Total RunTime
Syn1_Impl1	host_1	run1	Done	34	48 (2%)	32 (1%)	0h 0m 54s
Syn2_Impl1	host_1	run2	Done	34	48 (2%)	32 (1%)	0h 0m 54s
Syn2_Impl2	host_1	run3	Done	561	30 (1%)	32 (1%)	0h 0m 39s

Running SmartXplorer using custom strategies is similar to running SmartXplorer with the predefined strategies:

- At the beginning, SmartXplorer runs all custom synthesis strategies. It uses the first implementation strategy (Impl1) from the custom strategy file as a Quick Implementation strategy.
- As soon as all synthesis strategies are completed, SmartXplorer selects the best netlist based on timing score and runtime (Syn2 in our case) and runs it using remaining custom implementation strategies (Impl2 in our case).

Conclusion

In this lab, we created a custom strategy file and used it to run our design.

Lab 3: Running Multiple Strategies in Parallel

IMPORTANT: This lab is dedicated to users having one of the following:

- Access to a regular Linux network, LSF and SGE compute farms.
- A multi-core processor or a multi-processor machine (not a single core processor machine).

Objectives

The goal of this 10-minute lab is to show how to setup the Xilinx® environment and use SmartXplorer on a regular Linux network, LSF and SGE compute farms, or on a single, multi-core processor or a multi-processor machine.

We will list a set of key items you must take into account before using SmartXplorer across such networks.

Lab

Step 1: Key Items – Xilinx Environment and Results Storage

There are two important items we must clarify before launching SmartXplorer:

- How to setup Xilinx software environment on each machine.
- Where SmartXplorer results will be stored.

1. Setting up Xilinx environment

First, let's consider the case of a regular Linux network, where three Linux machines (L1, L2, and L3) will be used to run design strategies in parallel. In addition, L1 will be used to launch SmartXplorer.

Before launching a job on L2 (L3), SmartXplorer automatically sets up \$XILINX environment variable on the L2 (L3) machine. For that, it will use the value of \$XILINX from L1. This means that if Xilinx software is installed on:

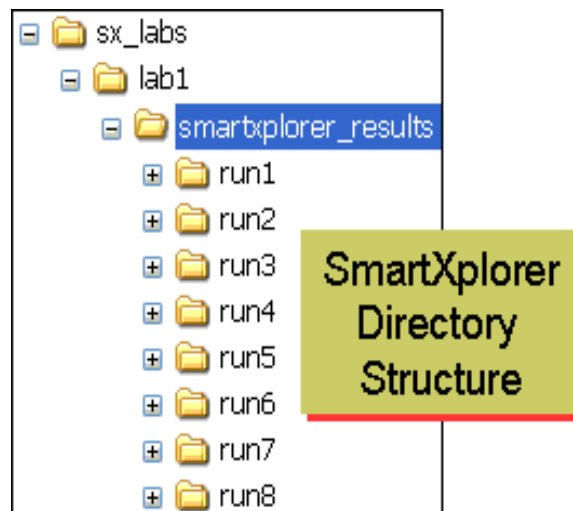

- the network, then L2 (L3) must have access to this installation as well using the same network mount points so that the network paths defined for L1 are valid for all machines.
- the L1 local disk, then L2 (L3) must have the same version of Xilinx software installed on a local disk and placed in the directory with same path name as on L1.

This mechanism of using environment variables was created to ensure that each design strategy will be run under the same conditions. In addition to \$XILINX, SmartXplorer will automatically collect all Xilinx environment variables (having the 'XIL_' prefix) set on L1 and propagate them to L2 and L3.

The same rules must be used for **LSF** and **SGE** compute farms – each machine eligible to run Xilinx software must be able to use the same Xilinx environment as set on the machine running SmartXplorer.

2. Results Storage

As we have seen in Lab 1, all SmartXplorer results are stored in a separate directory, named **smartxplorer_results**.

The same method is used in the case of multiple machines; all results are stored in the same disk area. Therefore, all machines must have access to this disk area and have read and write permissions.

Step 2: Pre-run Checklist

1. Obtain the list of machines you will use.
2. Ensure that the same Xilinx® environment can be set up on each of them.
3. Verify that all machines have access and read and write permissions to the SmartXplorer results directory.

Step 3: Setup Xilinx Environment

1. Open a terminal window and setup Xilinx environment.
2. Go to the **lab3** directory: **cd ../lab3**

Step 4: Run SmartXplorer on a Regular Linux Network

In this step, we will run the seven predefined SmartXplorer strategies on two Linux machines: `host_1` and `host_2`. Suppose that `host_1` can run two jobs and `host_2` a single job in parallel. We will use `host_1` to run SmartXplorer.

1. Open `my_hostlist.txt` file located in `lab3` directory using any text editor. This file contains the list of machines which will be used to run design strategies. The format of this file is straightforward; each machine name must be placed in a separate line:

```
host_1
host_1
host_2
```

To enable running two jobs in parallel on the same machine, we must list this machine twice, as it is done for `host_1`.

Note: Please replace `host_1` and `host_2` with your machine names in the `my_hostlist.txt` file and save it before continuing.

2. Specify the `my_hostlist.txt` file via `-l` option.
3. In the current terminal window launch SmartXplorer using the following command:

```
smartxplorer -p xc6slx4-3-tgg144 -uc stopwatch.ucf -wd
smartxplorer_results -sd ipcore_dir -l my_hostlist.txt stopwatch.xst
```
4. You might get the following status table, where more powerful `host_1` was able to complete nine out of thirteen strategies:

Strategy	Host	Output	Status	Timing Score	Luts	Slice Registers	Total RunTime
XSTOptReshRedcon_MapRunTime	host_1	run1	Done	2118	30 (1%)	29 (1%)	0h 1m 19s
XSTOptOnehot_MapRunTime	host_1	run2	Done	1895	30 (1%)	32 (1%)	0h 0m 54s
XSTOnehot_MapRunTime	host_2	run3	Done	1895	30 (1%)	32 (1%)	0h 1m 35s
XSTOptOnehotRedcon_MapRunTime	host_1	run4	Done	1895	30 (1%)	32 (1%)	0h 0m 54s
XSTRegbalOptOnehot_MapRunTime	host_2	run5	Done	1895	30 (1%)	32 (1%)	0h 1m 29s
XSTOnehotRedcon_MapRunTime	host_1	run6	Done	1895	30 (1%)	32 (1%)	0h 0m 45s
XSTRegbalOptOnehotReshRedcon_MapRunTime	host_1	run7	Done	1895	30 (1%)	32 (1%)	0h 0m 55s
XSTOnehotRedcon_MapGlobOptLogOptRegDup	host_1	run8	Done	34	48 (2%)	32 (1%)	0h 0m 49s
XSTOnehotRedcon_MapGlobOptIOReg	host_1	run9	Done	5784	48 (2%)	22 (1%)	0h 0m 44s
XSTOnehotRedcon_MapRegDup	host_2	run10	Done	561	30 (1%)	32 (1%)	0h 1m 33s
XSTOnehotRedcon_MapExtraEffortIOReg	host_1	run11	Done	4283	30 (1%)	22 (1%)	0h 0m 40s
XSTOnehotRedcon_MapLogOptRegDup	host_1	run12	Done	701	30 (1%)	32 (1%)	0h 0m 40s
XSTOnehotRedcon_MapExtraEffort2	host_2	run13	Done	784	30 (1%)	32 (1%)	0h 1m 40s

Note: SmartXplorer might stop all currently running strategies if another strategy is completed and met timing. This situation appears when multiple strategies are run in parallel and the `-ra` (Run all) option is not used.

Strategy	Host	Output	Status	Timing Score	Luts	Slice Registers	Total RunTime
XSTOnehotRedcon_MapExtraEffort2	host_2	run13	Done	784	30 (1%)	32 (1%)	0h 1m 40s
XSTOnehotRedcon_MapGlobOptLogOptRegDupCT2	host_1	run14	Done	129	48 (2%)	32 (1%)	0h 0m 44s
XSTOnehotRedcon_MapGlobOptLogOptRegDupCT3	host_1	run15	Done	0	48 (2%)	32 (1%)	0h 0m 44s
XSTOnehotRedcon_MapGlobOptLogOptRegDupCT4	host_2	run16	Stopped	None	48 (2%)	32 (1%)	0h 1m 5s

Let's review the status of the two strategies that are surrounded by the red rectangle. Chronologically, XSTOnehotRedcon_MapGlobOptLogOptRegDupCT4 was started after XSTOnehotRedcon_MapGlobOptLogOptRegDupCT3 and then XSTOnehotRedcon_MapGlobOptLogOptRegDupCT3 was subsequently able to meet timing before XSTOnehotRedcon_MapGlobOptLogOptRegDupCT4 was completed. Therefore, SmartXplorer stopped XSTOnehotRedcon_MapGlobOptLogOptRegDupCT4 execution and you see the Stopped status in the Status column.

Step 5: Run SmartXplorer on LSF or SGE

Dealing with LSF and SGE compute farms is not much different than working with a regular Linux network (shown above). You must create a host list file and specify it in the "Use host list file" field.

The main difference exists in the definition of LSF and SGE in the host list file. The definition format for both compute farms is shown in the following table:

LSF	:LSF {"queue_name": "MYQUEUE", "max_concurrent_runs":N, "bsub_options": "additional_options"}
SGE	:SGE {"queue_name": "MYQUEUE", "max_concurrent_runs":N, "qsub_options": "additional_options"}

Where:

- **queue_name** defines the queue name. You must replace MYQUEUE with an LSF or SGE queue name.
- **max_concurrent_runs** defines the maximum number of jobs which can be run in parallel. You must replace N with a positive integer value.
- **bsub_options** allows you to define additional LSF options and additional_options must be replaced by the LSF options. If no options are used, then replace additional_options with an empty string: "".
- **qsub_options** allows you to define additional SGE options and additional_options must be replaced by the SGE options. If no options are used, then replace additional_options with an empty string: "".

Example:

If the queue name is **lin64_q**, the maximum number of parallel jobs is **six** and there are no specific LSF and SGE options; the host list files should contain the following information:

LSF	:LSF {"queue_name": "lin64_q", "max_concurrent_runs":6, "bsub_options": ""}
SGE	:SGE {"queue_name": "lin64_q", "max_concurrent_runs":6, "qsub_options": ""}

Conclusion

In this lab, we showed how you can use SmartXplorer to run several design strategies in parallel on multiple Linux Machines.

We listed a set of key items that must be taken into account before using SmartXplorer across the network.

Custom Files

Objectives

This appendix provides examples for:

- [Custom Strategy File](#)
- [Host List Files \(Linux\)](#)
- [SmartXplorer Configurations for Various Tasks: Synthesis and Implementation Flow](#)
- [SmartXplorer Configurations for Various Tasks: Implementation Flow Only](#)

Custom Strategy File

Following is an example of a custom strategy file. It contains two strategies for Spartan®-6 devices and two strategies for Virtex®-6 devices.

```
{
  "spartan6":
  {
    "XST Options":
    (
      {"name": "Syn1", "xst": "--fsm_encoding one-hot -
reduce_control_sets auto"},
      {"name": "Syn2", "xst": "--register_balancing yes -opt_level 2 -
fsm_encoding one-hot -resource_sharing no -reduce_control_sets auto"},
    ),

    "MAP-Par options":
    (
      {"name": "Impl1",
       "map": "--ol high -xe n -global_opt speed -logic_opt on -
register_duplication on -w",
       "par": "--ol high -xe n"},
      {"name": "Impl2",
       "map": "--ol high -xe n -register_duplication on -w",
       "par": "--ol high -xe n"},
    ),
  },

  "virtex6":
  {
    "XST Options":
    (
      {"name": "Syn3", "xst": "--fsm_encoding one-hot -opt_level 2"},
      {"name": "Syn4", "xst": "--register_balancing yes -fsm_encoding
one-hot -resource_sharing no -reduce_control_sets auto"},
    ),
  },
}
```

```

    ),
    "MAP-Par options":
    (
      {"name": "Impl3",
       "map": "-ol high -xe n -global_opt speed -logic_opt on -w",
       "par": "-ol high -xe n"},
      {"name": "Impl4",
       "map": "-ol high -xe n -w",
       "par": "-ol high -xe n"},
    ),
  },
}

```

Host List Files (Linux)

Regular Linux Network

The following example shows a host list file for a regular Linux network.

```

lin_machine_1
lin_machine_1
lin_machine_2
lin_machine_3

```

According to this example, SmartXplorer runs four strategies simultaneously. They are run on three different Linux machines and **lin_machine_1** runs two strategies in parallel.

LSF Compute Farm

The following example shows a host list file for LSF compute farm. In this example, the name of the queue is **lin64_q** and the maximum number of parallel jobs is **six**.

```

:LSF {"queue_name":"lin64_q", "max_concurrent_runs":6, "bsub_options": ""}

```

SGE Compute Farm

Following is an example of a host list file for SGE compute farm. In this example, the name of the queue is **lin64_q** and the maximum number of parallel jobs is **6**.

```

:SGE {"queue_name":"lin64_q", "max_concurrent_runs":6, "qsub_options": ""}

```

SmartXplorer Configurations for Various Tasks: Synthesis and Implementation Flow

Task 1: Run all built-in predefined strategies

The following script runs all synthesis and implementation built-in predefined strategies (the **-m** option with a default value of **13** is skipped). They are executed on the machines specified in the host list file (**-l** option). The execution stops as soon as timing is met.

```
smartxplorer -p xc6slx4-3-tqg144 -uc <file>.ucf -l <host_list_file>  
<design>.xst
```

Task 2: Run the first three built-in predefined strategies

The following script runs the first three synthesis (with Quick Implementation) built-in predefined strategies (-m 3 option). They are executed on the machines specified in the host list file (-l option). The execution stops as soon as timing is met.

```
smartxplorer -p xc6slx4-3-tqg144 -uc <file>.ucf -l <host_list_file> -m  
3 <design>.xst
```

Task 3: Run all built-in, predefined strategies and five additional iterations with different Cost Tables

Phase 1: This script runs all thirteen built-in predefined strategies first.

Phase 2: SmartXplorer selects the best strategy from phase-1 and runs it five additional times with different Cost Tables (-m 18 option: 13+5=18).

Strategies are executed on the machines specified in the host list file (-l option).

The execution stops as soon as timing is met.

```
smartxplorer -p xc6slx4-3-tqg144 -uc <file>.ucf -l <host_list_file> -m  
18 <design>.xst
```

Task 4: Run all custom strategies and 3 additional iterations with different Cost Tables

In this example, we suppose that the custom strategy file contains only two implementation strategies.

Phase 1: This script runs the two strategies specified in the custom strategy file (-sf option).

Phase 2: SmartXplorer selects the best strategy from phase-1 and runs it three additional times with different Cost Tables (-m 6 option: 2+3=6).

Strategies are executed on the machines specified in the host list file (-l option).

All five strategies are run regardless of the timing results (-ra option).

```
smartxplorer -p xc6slx4-3-tqg144 -uc <file>.ucf -l <host_list_file> -m 6 -  
sf <strategy_file> -ra <design>.xst
```

SmartXplorer Configurations for Various Tasks: Implementation Flow Only

Task 1: Run all built-in predefined strategies

The following script runs all implementation built-in predefined strategies (the -m option with a default value of 7 is skipped). They are executed on the machines specified in the host list file (-l option). The execution stops as soon as timing is met.

```
smartxplorer -p xc6slx4-3-tqg144 -uc <file>.ucf -l <host_list_file> <design>.ngc
```

Task 2: Run the first three built-in predefined strategies

The following script runs the first three implementation built-in predefined strategies (**-m 3** option). They are executed on the machines specified in the host list file (**-l** option). The execution stops as soon as timing is met.

```
smartxplorer -p xc6slx4-3-tqg144 -uc <file>.ucf -l <host_list_file> -m
3 <design>.ngc
```

Task 3: Run all built-in, predefined strategies and five additional iterations with different Cost Tables

Phase 1: This script runs all seven implementation built-in predefined strategies first.

Phase 2: SmartXplorer selects the best strategy from phase-1 and runs it five additional times with different Cost Tables (**-m 12** option: 7+5=12).

Strategies are executed on the machines specified in the host list file (**-l** option).

The execution stops as soon as timing is met.

```
smartxplorer -p xc6slx4-3-tqg144 -uc <file>.ucf -l <host_list_file> -m
12 <design>.ngc
```

Task 4: Run all custom strategies and 3 additional iterations with different Cost Tables

In this example, we suppose that the custom strategy file contains only two implementation strategies.

Phase 1: This script runs the two strategies specified in the custom strategy file (**-sf** option).

Phase 2: SmartXplorer selects the best strategy from phase-1 and runs it three additional times with different Cost Tables (**-m 5** option: 2+3=5).

Strategies are executed on the machines specified in the host list file (**-l** option).

All five strategies are run regardless of the timing results (**-ra** option).

```
smartxplorer -p xc6slx4-3-tqg144 -uc <file>.ucf -l <host_list_file> -m
5 -sf <strategy_file> -ra <design>.ngc
```

Creating XST Script File

If you use Xilinx tools in command line mode, then you must use the same *design.xst* script file that you use to run XST in the command line mode.

If ISE®Project Navigator uses your default design environment, you will find *design.xst* in the project directory. This file is automatically generated by Project Navigator when you launch XST, and it must be used as an input file to launch SmartXplorer.

Please note that other files and directories can be referenced from *design.xst*:

- *design.prj* - XST project file (mandatory)
- *design.xcf* - XST constraint file
- *design.lso* - Library search order file
- etc.

Therefore we suggest to launch SmartXplorer from the project directory.
